Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q98-Q103):

NEW QUESTION # 98

Which two settings are standard Cisco console connections when configuring a terminal emulator to connect to the console port of a Cisco switch? (Choose two.)

- A. Flow control: Hardware
- B. Parity: Even
- C. Data bits: 8
- D. Speed (baud rate): 9600
- E. Stop bits: 2

Answer: C,D

Explanation:

When configuring a terminal emulator (such as PuTTY, Tera Term, or HyperTerminal) to connect to the console port of a Cisco switch, the standard settings are as follows:

Speed (baud rate): 9600

This is the default transmission speed for Cisco console ports, ensuring compatibility across various devices.

Data bits: 8

This setting specifies that each character transmitted consists of 8 data bits, which is standard for most serial communications.

Parity: None

No parity bit is used, meaning there is no additional error-checking bit appended to each character.

Stop bits: 1

One stop bit indicates the end of a character transmission.

Flow control: None

No flow control is employed, allowing continuous data transmission without hardware or software-based pausing.

Therefore, options C (Speed: 9600) and D (Data bits: 8) are correct. Options A (Stop bits: 2), B (Flow control: Hardware), and E

(Parity: Even) deviate from the standard settings and may result in communication issues if configured.

NEW QUESTION # 99

Refer to the exhibit. Drag and drop the command names from the left onto the corresponding elements in the interface configuration mode command structure on the right.

Answer:

Explanation:

Explanation:

- * Component to configure# interface
- * Interface type# FastEthernet
- * Port# 1
- * Slot# 0

This command structure is part of the Device Configuration and Verification section in the FLDTEC course.

It teaches how to navigate and configure interfaces on Cisco devices using the IOS CLI:

- * interface is the global configuration mode command to begin configuring a network interface.
- * FastEthernet specifies the type of interface (could also be GigabitEthernet, Serial, etc.).
- * 0/1 represents the slot/port structure used on Cisco devices:
- * The first digit (before the slash) is the slot number.
- * The second digit (after the slash) is the port number within that slot.

This structure allows Cisco to modularly address interfaces, especially in devices with multiple slots or module-based configurations.

NEW QUESTION # 100

Which command is used to specify the source for the Cisco IOS software image to load during the boot process?

- A. boot image
- B. boot source
- **C. boot system**
- D. boot ios

Answer: C

Explanation:

The boot system command is used in global configuration mode to specify the source and filename of the Cisco IOS software image that should be loaded during the device's boot process. This command ensures that the device loads a specific IOS image, whether it's stored locally in flash or fetched from a TFTP server.

Syntax example:

```
boot system flash:c1900-universalk9-mz.SPA.157-3.M3.bin
```

* boot image, boot ios, and boot source are invalid or non-existent in standard Cisco IOS.

NEW QUESTION # 101

Which term describes the physical range of radio frequency coverage provided by an access point in a wireless topology?

- A. Wireless LAN Controller (WLC)
- B. Service Set Identifier (SSID)
- **C. Basic Service Area (BSA)**
- D. Wireless LAN (WLAN)

Answer: C

Explanation:

In wireless networking, the Basic Service Area (BSA) refers to the physical area of radio frequency coverage provided by an access point (AP) in a Basic Service Set (BSS). The BSA defines the coverage area where wireless clients can connect to the network through the AP. The size and shape of a BSA depend on various factors, including the AP's transmit power, antenna type, and physical environment.

Option A, the Service Set Identifier (SSID), is the network name broadcast by the AP. Option C, Wireless LAN (WLAN), refers to the overall wireless network. Option D, Wireless LAN Controller (WLC), is a device that manages multiple APs in a network.

NEW QUESTION # 102

Refer to the exhibit. What are two ways remote sites or branches connect to the enterprise campus network? (Choose two.)

- A. Ad hoc Wi-Fi network
- B. LAN core switches
- C. Access layer switches
- D. WAN links
- E. IPsec VPN tunnels

Answer: D,E

Explanation:

In enterprise networking, remote sites or branch offices connect to the central campus network using:

* WAN Links: These are dedicated communication paths that connect geographically dispersed networks. WAN links can be leased lines, MPLS circuits, or other forms of long-distance connectivity that facilitate reliable data transmission between remote sites and the main campus.

* IPsec VPN Tunnels: Internet Protocol Security (IPsec) VPNs provide secure, encrypted tunnels over the public internet, allowing remote sites to connect to the enterprise network securely. This method is cost-effective and widely used for connecting branch offices to the central network infrastructure.

Access layer switches (Option A) and LAN core switches (Option E) are components within a local network and do not facilitate remote connectivity. Ad hoc Wi-Fi networks (Option D) are temporary and lack the security and reliability required for enterprise-level remote connections.
