## Fortinet NSE 7 - Public Cloud Security 7.6 Architect Sample Questions (Q41-Q46):

### NEW QUESTION # 41

Refer to the exhibit. You deployed a FortiGate HA active-passive cluster in Microsoft Azure. Which two statements regarding this particular deployment are true? (Choose two.)

#### FortiGate HA configuration

```
config system sdn-connector
  edit "azure-globalsdn-iam-ha"
    set status enable
    set type azure
    set use-metadata-iam enable
    set ha-status enable
    set subscription-id ""
    set resource-group ""
    set azure-region global
    config nic
      edit "fgta-ap-port1"
        config ip
          edit "ipconfig1"
            set public-ip "fgt-ap-cluster"
            set resource-group "fortigate-ha-training"
          next
        end
      next
    end
  next
end
config route-table
  edit "az_spoke1_useast_web"
    set subscription-id "bc0e730b-2345-4c66-9a74-efdfc1xxxxxx"
    set resource-group "fortigate-ha-training"
    config route
      edit "default_spoke1_web"
        set next-hop "10.60.5.4"
      next
      edit "az_spoke1_useast_app"
        set next-hop "10.60.5.4"
      next
    end
  next
end
set update-interval 40
next
end
```

- A. The configuration does not synchronize between the primary and secondary devices.
- B. You can use the vim-exception command to synchronize the configuration.
- C. During a failover, all existing sessions are transferred to the new active FortiGate.
- D. There is no SLA for API calls from Microsoft Azure.

Answer: B,D

Explanation:

In Azure HA for FortiGate, failover relies on Azure API calls to update routing and public IP associations. Microsoft does not provide an SLA for these API calls, which can affect failover timing.

FortiGate HA in Azure supports configuration synchronization, but you can exclude specific VDOMs from syncing using the vdom-exception command.

### NEW QUESTION # 42

Refer to the exhibit. An administrator has deployed a FortiGate VM in Amazon Web Services (AWS) and is trying to access it using

its public IP address from their local computer. However, the connection is not successful, and at the same time FortiGate is not receiving any HTTPS or SSH traffic to its external interface.

What should the administrator check for possible issue?

```
FGT-AP-SDN-Active #
FGT-AP-SDN-Active # diagnose sniffer packet any "host 76.6.2.2 and port 443" 4
Using Original Sniffing Mode
interfaces=[any]
filters=[host 76.6.2.2 and port 443]
```

- A. Check the FortiGate firewall policies.
- B. Check the debug flow for any network ACLs.
- C. **Check the inbound rules of the security groups.**
- D. Check the FortiGate instance ID.

**Answer: C**

Explanation:

Since the FortiGate VM is not receiving any HTTPS or SSH traffic at all, the most likely cause is that the inbound rules of the AWS Security Group attached to the FortiGate instance are not permitting traffic on ports 22 (SSH) or 443 (HTTPS). If the Security Group blocks traffic, packets never reach FortiGate, which explains the absence of captured traffic.

#### NEW QUESTION # 43

As part of your organization's monitoring plan, you have been tasked with obtaining and analyzing detailed information about the traffic sourced at one of your FortiGate EC2 instances.

What can you do to achieve this goal?

- A. **Create a virtual public cloud (VPC) flow log at the network interface level for the EC2 instance.**
- B. Configure a network access analyzer scope with the EC2 instance as a match finding.
- C. Use AWS CloudTrail to capture and then examine traffic from the EC2 instance.
- D. Add the EC2 instance as a target in CloudWatch to collect its traffic logs.

**Answer: A**

Explanation:

VPC Flow Logs are designed to capture metadata about IP traffic to and from network interfaces in a VPC, including those attached to EC2 instances such as FortiGate appliances.

Creating a flow log at the network interface level for the FortiGate EC2 instance lets you collect detailed information (source/destination IPs, ports, protocol, action, bytes, etc.) for all traffic sourced from and going to that instance, which you can then analyze in CloudWatch Logs or S3.

#### NEW QUESTION # 44

An administrator is looking for a solution that can provide insight into users and data stored in major SaaS applications in the multicloud environment.

Which product should the administrator deploy to have secure access to SaaS applications?

- A. FortiSandbox
- B. FortiSIEM
- C. **FortiCASB**
- D. FortiWeb

**Answer: C**

Explanation:

FortiCASB (Cloud Access Security Broker) provides visibility and control over users, data, and security policies in major SaaS applications across multicloud environments, ensuring secure access and compliance.

#### NEW QUESTION # 45

An administrator is looking for a solution that can provide insight into users and data stored in major SaaS applications in the multicloud environment. Which product should the administrator deploy to have secure access to SaaS applications? (Choose one answer)

- A. FortiSandbox
- B. FortiSIEM
- C. **FortiCASB**
- D. FortiWeb

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From FortiOS 7.6, FortiWeb 7.4 Exact Extract study guide:

Based on the Fortinet Cloud Security 7.4 documentation and the FortiCASB Administration Guide, securing a multicloud environment requires specialized tools for Software-as-a-Service (SaaS) visibility:

\* SaaS Visibility and Protection (Option B): FortiCASB (Cloud Access Security Broker) is a cloud-native service designed specifically to provide insight into users and data stored within major SaaS applications like Office 365, Google Drive, and Salesforce.

\* Key Capabilities:

\* Data Discovery: It allows administrators to scan and identify sensitive data (PII, PCI, etc.) stored within SaaS platforms to prevent data leakage.

\* User Behavior Monitoring: It tracks user activities and alerts on anomalous behavior, such as logins from suspicious locations or excessive file downloads, to ensure secure access.

\* Threat Protection: It integrates with FortiGuard to scan files within the cloud for malware, providing a layer of security that traditional network firewalls cannot reach once the data is inside the SaaS provider's infrastructure.

\* Why other options are incorrect:

\* Option A: FortiSandbox is used for advanced threat detection by executing suspicious files in a safe environment; it does not provide user/data management for SaaS applications.

\* Option C: FortiWeb is a Web Application Firewall (WAF) designed to protect web applications and APIs hosted on-premises or in the cloud from attacks like SQL injection; it is not a SaaS security broker.

\* Option D: FortiSIEM is a security information and event management solution used for cross-infrastructure logging and correlation; while it can ingest logs from SaaS, it does not provide the native data-level insights or direct access controls that FortiCASB offers.
