Salesforce Data-Architect Valid Test Vce Free & Data-Architect Reliable Test Experience

By browsing this website, all there versions of Data-Architect training materials can be chosen according to your taste or preference. In addition, we provide free updates to users for one year long after your purchase. If the user finds anything unclear in the Data-Architect Exam Questions exam, we will send email to fix it, and our team will answer all of your questions related to the Data-Architect actual exam. So as long as you have any question, just contact us!

Salesforce Certified Data Architect Sample Questions (Q95-Q100):

NEW QUESTION # 95

Universal Containers has a custom object with millions of rows of data.

When executing SOQL queries, which three options prevent a query from being selective? (Choose three.)

- A. Performing large loads and deletions.
- B. Using leading % wildcards.
- C. Using a custom index on a deterministic formula field.
- D. Using NOT and != operators.
- E. Using trailing % wildcards.

Answer: B,C,D

NEW QUESTION # 96

Universal Containers wants to automatically archive all inactive Account data that is older than 3 years. The information does not need to remain accessible within the application. Which two methods should be recommended to meet this requirement? Choose 2 answers

- A. Use the Force.com Workbench to export the data.
- B. Schedule a weekly export file from the Salesforce UI.
- C. Schedule jobs to export and delete using an ETL tool.
- D. Schedule jobs to export and delete using the Data Loader.

Answer: C,D

NEW QUESTION # 97

Universal Containers has more than 10 million records in the Order_c object. The query has timed out when running a bulk query. What should be considered to resolve query timeout?

- A. Streaming API
- B. Metadata API
- C. Tooling API
- D. PK Chunking

Answer: D

Explanation:

PK Chunking can resolve query timeout when running a bulk query on an object with more than 10 million records. PK Chunking is a feature of the Bulk API that splits a query into multiple batches based on the record IDs (primary keys) of the queried object. This can improve the query performance and avoid timeouts by reducing the number of records processed in each batch.

NEW QUESTION # 98

NTO has outgrown its current salesforce org and will be migrating to new org shortly. As part of this process NTO will be migrating all of its metadata and data. NTO's data model in the source org has a complex relationship hierarchy with several master detail and lookup relationships across objects, which should be maintained in target org.

What 3 things should a data architect do to maintain the relationship hierarchy during migration?

Choose 3 answers:

- A. Keep the relationship fields populated with the source record ID's in the import file.
- B. Redefine the master detail relationship fields to lookup relationship fields in the target org.
- C. Create an external id field for each object in the target org and map source record ID's to this field.
- D. Use data loader to export the data from source org and then import or Upsert into the target org in sequential order.
- E. Replace source record ID's with new record ID's from the target org in the import file.

Answer: C,D,E

Explanation:

The correct answer is A, B, and D. To maintain the relationship hierarchy during migration, a data architect should use data loader to export the data from source org and then import or upsert into the target org in sequential order, create an external ID field for each object in the target org and map source record IDs to this field, and replace source record IDs with new record IDs from the target org in the import file. These steps will ensure that the records are linked correctly and the relationships are preserved. Option C is incorrect because redefining the master detail relationship fields to lookup relationship fields in the target org will change the behavior and security of the data model. Option E is incorrect because keeping the relationship fields populated with the source record IDs in the import file will cause errors and prevent the records from being imported.

NEW QUESTION # 99

Universal Containers (UC) has an Application custom object, which has tens of millions of records created in the past 5 years. UC needs the last 5 years of data to exist in Salesforce at all times for reporting and queries. UC is currently encountering performance issues when reporting and running queries on this Object using date ranges as filters. Which two options can be used to improve report performance?

- A. Add custom indexes to all fields on Application without a standard index.
- B. Run multiple reports to get different pieces of the data and combine them.
- C. Ask support to create a skinny table for Application with the necessary reporting fields.
- D. Add custom indexes to the Date fields used for filtering the report.

Answer: C,D

Explanation:

Ask support to create a skinny table for Application with the necessary reporting fields. This is an option that can improve report performance by creating a custom table that contains frequently used fields and copies their values from standard or custom objects. Skinny tables are kept in sync with their source tables and are used in place of them for reports and queries. Add custom indexes to the Date fields used for filtering the report. This is another option that can improve report performance by creating custom indexes on fields that are often used as filters or join conditions in reports and queries. Custom indexes can speed up data retrieval and reduce query execution time

NEW QUESTION # 100

.....

Although the Salesforce Data-Architect exam prep is of great importance, you do not need to be over concerned about it. With scientific review and arrangement from professional experts as your backup, and the most accurate and high quality content of our Salesforce Data-Architect Study Materials, you will cope with it like a piece of cake. So Salesforce Data-Architect learning questions will be your indispensable practice materials during your way to success.
