

# Latest CCDAK Braindumps | High Pass-Rate Confluent Cert CCDAK Exam: Confluent Certified Developer for Apache Kafka Certification Examination

2026 Latest Test4Cram CCDAK PDF Dumps and CCDAK Exam Engine Free Share: <https://drive.google.com/open?id=1XKVs7W4jQvRB025euvQRM4e093PhYI2y>

For offline practice, our Confluent Certified Developer for Apache Kafka Certification Examination (CCDAK) desktop practice test software is ideal. This Confluent Certified Developer for Apache Kafka Certification Examination (CCDAK) software runs on Windows computers. The Confluent Certified Developer for Apache Kafka Certification Examination (CCDAK) web-based practice exam is compatible with all browsers and operating systems. No software installation is required to go through the web-based Confluent Certified Developer for Apache Kafka Certification Examination (CCDAK) practice test.

The CCDAK certification exam is offered by Confluent, the company that created Apache Kafka. CCDAK exam is designed to be rigorous and challenging, and passing it requires a deep understanding of Kafka-based solutions and their application to real-world use cases. The CCDAK Certification is a valuable credential for developers who work with Kafka and want to demonstrate their expertise to potential employers or clients.

## **New Confluent CCDAK Dumps - Get Ready With CCDAK Exam Questions [2026]**

Our worldwide after sale staff will be online for 24/7 and reassure your rows of doubts on our CCDAK exam questions as well as exclude the difficulties and anxiety with all the customers. Just let us know your puzzles and we will figure out together. You can contact with us at any time and we will give you the most professional and specific suggestions on the CCDAK Study Materials. What is more, you can free download the demos of the CCDAK learning guide on our website to check the quality and validity.

## **Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q32-Q37):**

### **NEW QUESTION # 32**

You use Kafka Connect with the JDBC source connector to extract data from a large database and push it into Kafka. The database contains tens of tables, and the current connector is unable to process the data fast enough. You add more Kafka Connect workers, but throughput doesn't improve. What should you do next?

- A. Modify the database schemas to enable horizontal sharding.
- B. Increase the number of Kafka partitions for the topics.
- **C. Increase the value of the connector's property tasks.max.**
- D. Add more Kafka brokers to the cluster.

**Answer: C**

Explanation:

Increasing `tasks.max` allows the connector to create multiple tasks, each responsible for processing different tables or table partitions. If only one task is used, adding more workers has no effect.

From [Kafka Connect JDBC Connector Docs](#):

"Use `tasks.max` to configure how many tasks are created for the connector. Each task can process a subset of the data."

\* A and C help only if the bottleneck is in Kafka, not Connect.

\* D is a large architectural change, not the first step.

Reference: [Kafka Connect JDBC Connector Configuration](#)

### NEW QUESTION # 33

Once sent to a topic, a message can be modified

- A. No
- B. Yes

**Answer: A**

Explanation:

Kafka logs are append-only and the data is immutable

### NEW QUESTION # 34

(You are writing lightweight XML messages to a Kafka topic named `userinfo`.)

Which format should you use for the value field?)

- A. `VoidSerializer`
- B. `ByteSerializer`
- C. `XmlSerializer`
- D. `StringSerializer`

**Answer: D**

Explanation:

Apache Kafka does not impose any schema or message format; it treats records as byte arrays on the wire.

Serialization is therefore the responsibility of the producer. For lightweight XML messages, the most common and recommended approach is to represent the XML as a UTF-8 encoded string and use Kafka's built-in `StringSerializer`.

The official Kafka producer documentation provides `StringSerializer` as the standard serializer for textual data formats, including XML and JSON. This serializer converts Java String objects into byte arrays using UTF-8 encoding, making it simple, efficient, and interoperable with a wide range of consumers.

Option A is incorrect because Kafka does not provide a built-in `XmlSerializer`. Option C (`ByteSerializer`) could technically work, but it would require manually converting the XML string to a byte array, which adds unnecessary complexity for lightweight XML payloads. Option D (`VoidSerializer`) is used only when no value is sent and is not applicable here.

Therefore, using `StringSerializer` for the value field is the correct and officially supported approach for sending lightweight XML messages in Kafka.

### NEW QUESTION # 35

If I produce to a topic that does not exist, and the broker setting `auto.create.topic.enable=true`, what will happen?

- A. Kafka will automatically create the topic with the broker settings `num.partitions` and `default.replication.factor`
- B. Kafka will automatically create the topic with `num.partitions=#of brokers` and `replication.factor=3`
- C. Kafka will automatically create the topic with 1 partition and 1 replication factor
- D. Kafka will automatically create the topic with the indicated producer settings `num.partitions` and `default.replication.factor`

**Answer: A**

Explanation:

The broker settings comes into play when a topic is auto created

### NEW QUESTION # 36

Your company has three Kafka clusters: Development, Testing, and Production. The Production cluster is running out of storage, so you add a new node. Which two statements about the new node are true? (Select two.)

- A. A new node can be added without stopping existing cluster nodes.
- B. A node ID will be assigned to the new node automatically.
- C. A newly added node will have KRaft controller role by default.
- D. A new node will not have any partitions assigned to it unless a new topic is created or reassignment occurs.

Answer: A,D

Explanation:

\* C is true: When a new broker is added, no partitions are assigned to it unless you create new topics or reassign existing ones using `kafka-reassign-partitions.sh`.

\* D is true: Kafka brokers are hot-pluggable; no need to stop the cluster when scaling.

From Kafka Operations Guide:

"A newly added broker won't be assigned partitions until reassignments or new topic creation."

"Kafka allows dynamic scaling by adding brokers without downtime."

\* A is false: Broker IDs must be manually set unless using dynamic broker registration in KRaft mode.

\* B is false unless the cluster uses KRaft mode and the broker is specifically assigned a controller role.
