## Latest 220-1101 Test Guide - Reliable 220-1101 Exam Answers

There are great and plenty benefits after the clients pass the test. Because the knowledge that our 220-1101 study materials provide is conducive to enhancing the clients' practical working abilities and stocks of knowledge, the clients will be easier to increase their wages and be promoted by their boss. Besides, they will be respected by their colleagues, friends and family members and be recognized as the elites among the industry. They will acquire more access to work abroad for further studies. So the clients must appreciate our 220-1101 Study Materials after they pass the test.

## CompTIA A+ Certification Exam: Core 1 Sample Questions (Q752-Q757):

### NEW QUESTION # 752

An administrator configured multiple networked devices to store data that can be accessed as local storage. Which of the following did the administrator create?

- A. WLAN
- **B. SAN**
- C. PAN
- D. MAN

**Answer: B**

Explanation:

A Storage Area Network (SAN) is a network specifically designed to pool storage resources and make them accessible to servers as if they were locally attached drives. SANs are used in data centers for high-performance storage and retrieval of large volumes of data. This setup allows multiple networked devices to access shared storage as if it were local, which matches the scenario described. PAN (Personal Area Network), WLAN (Wireless LAN), and MAN (Metropolitan Area Network) serve different purposes and do not primarily focus on shared storage access.

### NEW QUESTION # 753

A user's laptop has been slow to respond for the past few days. The user has run a virus scan, deleted temporary files, closed unnecessary programs, and rebooted the laptop, but the issue persists. Which of the following steps should the technician take next?

- A. Bench test the laptop.
- **B. Run a firmware update.**
- C. Replace the laptop's hard drive.
- D. Perform a RAM upgrade.

**Answer: B**

Explanation:

Firmware is a type of software that controls the hardware components of a device, such as the motherboard, hard drive, or keyboard. Firmware updates can improve the performance, stability, and compatibility of the device, as well as fix bugs and security issues. Running a firmware update can help to resolve the issue of a slow laptop, especially if the firmware is outdated or corrupted.

### NEW QUESTION # 754

A user on the marketing team uses various multimedia applications that consume a lot of memory. The user needs to install more RAM to run these applications effectively. When the user opens the computer case, the user sees four slots in two sets of colors. Which of the following memory types is MOST likely required?

- A. Triple-channel
- B. Error correction code RAM
- **C. Dual-channel**
- D. Quad-channel
- E. Single-channel

**Answer: C**

Explanation:

A dual-channel motherboard might have four DIMM slots arranged in color-coded pairs. Each pair represents one channel. For example, channel A might be color-coded orange and channel B color-coded blue. Each slot in a pair represents one of the two sockets in the channel (A1 and A2, for instance).

### NEW QUESTION # 755

Which of the following network devices is needed to direct packets to networks outside of the LAN?

- A. Bridge
- **B. Router**
- C. Hub
- D. Switch

**Answer: B**

Explanation:

Routers are designed to connect multiple networks and direct packets to their intended destinations across network segments. This makes them essential for directing packets to networks outside of the LAN, such as the internet or other remote networks.

### NEW QUESTION # 756

Which of the following DNS records is used to look up the IP address assigned to a domain name?

- A. SPF
- B. NS
- C. MX
- **D. A**

**Answer: D**

Explanation:

A DNS record is a data entry in a DNS server that maps a domain name to a specific value, such as an IP address, a mail server, a name server, or a text string. There are different types of DNS records for different purposes, and each type has a specific format and syntax<sup>12</sup>.

The A record, also known as the address record, is the most common type of DNS record, and it is used to look up the IP address assigned to a domain name. The A record maps a domain name to an IPv4 address, which is a 32-bit numerical value that identifies a device on the internet. For example, the A record for `www.google.com` is `172.217.14.206`<sup>12</sup>.

The other options are not correct because they are not used to look up the IP address assigned to a domain name. The MX record, also known as the mail exchange record, is used to specify the mail servers that handle the email for a domain name. The MX record maps a domain name to a priority value and a host name of a mail server. For example, the MX record for `gmail.com` is `10 alt1.gmail-smtp-in.l.google.com`<sup>12</sup>.

The NS record, also known as the name server record, is used to delegate a domain name to a set of authoritative name servers.

The NS record maps a domain name to a host name of a name server that can provide authoritative answers for the domain name and its subdomains. For example, the NS record for `example.com` is `ns1.example.com`<sup>12</sup>.

The SPF record, also known as the sender policy framework record, is used to prevent email spoofing and spamming by validating the sender's identity. The SPF record maps a domain name to a text string that specifies the authorized mail servers and IP addresses that can send email on behalf of the domain name. For example, the SPF record for `microsoft.com` is `v=spf1 include:spf.protection.outlook.com -all`<sup>12</sup>.
