Salesforce Accredited B2B Commerce Developer Sample Questions (Q39-Q44):

NEW QUESTION # 39

Universal Containers (UC) needs to wrap a Lightning Web Component they have created called "lwcContainerComponent" inside an Aura component. Which set of tags is the correct approach?

- A.

```
<!-- auraWrapper.cmp -->
<aura:component>
  <aura:c:lwcContainerComponent />
</aura:component>
```
- B.

```
<!-- auraWrapper.cmp -->
<aura:component>
  <aura:lwcContainerComponent />
</aura:component>
```
- C.

```
<!-- auraWrapper.cmp -->
<aura-lwc:component>
  <c:lwcContainerComponent />
</aura-lwc:component>
```
- D.

```
<!-- auraWrapper.cmp -->
<aura:component>
  <c:lwcContainerComponent />
</aura:component>
```

Answer: D

Explanation:

To wrap a Lightning Web Component inside an Aura component, you need to use the `<c:lwcContainerComponent>` tag, where `c` is the default namespace for custom components. This tag allows you to reference the Lightning Web Component by its name and use it as a child component of the Aura component. You also need to use the `lwc:dom="manual"` directive on the Aura component to indicate that you are manually rendering the Lightning Web Component inside the Aura component. This directive prevents the Aura

component from interfering with the rendering of the Lightning Web Component. Option C shows the correct syntax for wrapping a Lightning Web Component inside an Aura component. Option A is incorrect because it uses the `<lightning:lwcContainerComponent>` tag, which is not a valid tag for referencing a Lightning Web Component. Option B is incorrect because it uses the `<aura:lwcContainerComponent>` tag, which is also not a valid tag for referencing a Lightning Web Component. Option D is incorrect because it does not use the `lwc:dom="manual"` directive on the Aura component, which is required for manually rendering a Lightning Web Component inside an Aura component. NEW QUESTION # 40

What is a valid way of referencing the global `cc_api_CartExtension` apex class via subscriber code?

- A. `ccrz__cc_api_CartExtension`
- B. `ccrz.cc_api_CartExtension`
- C. `c__cc_api_CartExtension`
- D. `cloudcraze.cc_api_CartExtension`

Answer: B

Explanation:

A valid way of referencing the global `cc_api_CartExtension` apex class via subscriber code is to use `ccrz.cc_api_CartExtension`. This is the name of the class that is defined in the cloudcraze managed package. The class is global, so it can be accessed by subscriber code. The other options are either invalid or incorrect. NEW QUESTION # 41

Which two Salesforce B2B Commerce visualforce pages must be enabled at a Salesforce Community level to make the out of the box SEO functionality available? (2 answers)

- A. `CCSizeIndex`
- B. `ProductMap`
- C. `SizeMap`
- D. `CCCatSiteMap`

Answer: A,D

Explanation:

Two Salesforce B2B Commerce Visualforce pages that must be enabled at a Salesforce Community level to make the out of the box SEO functionality available are:

* `CCSizeIndex`: This page generates a `sitemap.xml` file, which is a file that lists all the pages and resources on a site that can be crawled by web crawlers. The page uses the configuration settings `CO.SiteMapIncludeProducts` and `CO.SiteMapIncludeCategories` to specify which products and categories should be included in the sitemap.

* `CCCatSiteMap`: This page generates a category sitemap file, which is a file that lists all the categories on a site that can be crawled by web crawlers. The page uses the configuration setting `CO.SiteMapCategoryDepth` to specify how many levels of subcategories should be included in the category sitemap. NEW QUESTION # 42

Which event is triggered within Salesforce B2B Commerce whenever a cart's state changes?

- A. `pageMessage`
- B. `cartChange`
- C. `cartState`
- D. `cart`

Answer: B

Explanation:

Explanation

The event that is triggered within Salesforce B2B Commerce whenever a cart's state changes is cartChange.

This event is triggered by the updateCart method of the CCRZ.Cart class, which is responsible for updating the cart data and performing any actions that depend on the cart state, such as applying discounts, taxes, or shipping charges. The event can be used to notify all the components that are listening to it that the cart has changed and they should refresh their data accordingly. NEW QUESTION # 43

What are three ways to implement custom post Order processing? (3 answers)

- A. Modify or add custom Cart formula fields to handle logic.
- **B. Use Process builder to implement business processes that execute when an Order record is created.**
- C. Use a Salesforce workflow rule that executes when an Order record is created.
- **D. Extend cc_hk_invoice to handle custom business logic post Order processing**
- **E. Use cc_hk_Order.placeTarget to define a new Order Confirmation page which executes additional business logic.**

Answer: B,D,E

Explanation:

Three ways to implement custom post Order processing are:

* Extend cc_hk_invoice to handle custom business logic post Order processing. This hook allows modifying the invoice data or performing additional actions after an Order is placed. For example, the hook can send an email notification or update a custom field on the invoice record.

* Use cc_hk_Order.placeTarget to define a new Order Confirmation page which executes additional business logic. This hook allows specifying a custom Visualforce page that will be displayed after an Order is placed. The custom page can include additional business logic or user interface elements.

* Use Process Builder to implement business processes that execute when an Order record is created.

Process Builder is a tool that allows creating workflows and actions based on criteria and conditions. For example, Process Builder can create a task, send an email, or update a record when an Order record is created.
