API Source Inspector Electrical Equipment Sample Questions (Q95-Q100):

NEW QUESTION # 95

When a deviation from specifications, drawings, codes, or standards is identified, the source inspector should FIRST treat it as:

- A. a supplier observation only
- **B. a nonconformance**
- C. a schedule note
- D. a warranty issue

Answer: B

NEW QUESTION # 96

The primary purpose of the source inspection project plan is to provide the:

- A. safety and professional conduct policy for the inspector assigned to the supplier/vendor.
- B. basis for the risk assessment associated with each specific piece of equipment.
- C. project specific details on how the inspection activities performed will meet the expected quality.
- D. experience, training and certification record of each source inspector assigned to each supplier/vendor.

Answer: C

Explanation:

The correct answer is A. The source inspection project plan is the document that defines how inspection and surveillance will be carried out for a particular purchase order, package, or item of equipment so that the required quality expectations, contractual requirements, specifications, and critical inspection points are properly addressed. In practical API source inspection work, the plan establishes the scope of surveillance, identifies what documents will be reviewed, what hold or witness points will be observed, what tests will be witnessed, and how findings will be reported. Its purpose is therefore to give project-specific direction on how inspection activities will assure conformance to the purchaser's requirements.

Option B is not the best answer because risk assessment may help determine the plan, but it is not the plan's primary purpose.

Option C is incorrect because inspector qualifications may be maintained elsewhere in personnel records and are not the core function of the project plan. Option D is also incorrect because safety and conduct expectations are general organizational requirements, not the main objective of the source inspection project plan. The plan is fundamentally about how inspection will be executed to verify quality.

NEW QUESTION # 97

Which definition BEST matches an Instrument Ground Bus (IGB)?

- A. A temporary grounding point used only during shipping
- B. A neutral bus used for normal load current
- C. A bus used only for lightning protection
- D. A grounding system independent from AC safety ground for instrumentation signals, tied at one point

Answer: D

NEW QUESTION # 98

What tool is designed to measure mechanical oscillations?

- A. Oscilloscope
- B. Tachometer
- C. Spectroscope
- D. Vibration Meter

Answer: D

Explanation:

The correct answer is D. Vibration Meter. A vibration meter is specifically intended to measure mechanical oscillations, usually in terms of displacement, velocity, or acceleration. In source inspection of large electrical equipment, especially electric motors over 500 HP, vibration measurement is important because excessive vibration can indicate problems such as rotor imbalance, shaft misalignment, bearing defects, looseness, soft foot, resonance, or installation errors. Since the API source inspection guide covers surveillance and verification activities for major rotating electrical equipment, understanding the purpose of vibration-measuring instruments is directly relevant to factory testing, condition verification, and acceptance evaluation.

The other options are not correct for this function. A tachometer measures rotational speed, not mechanical oscillation.

A spectroscope is used for optical spectrum analysis and is unrelated to machinery vibration.

An oscilloscope displays electrical waveforms and can show signals from sensors, but it is not the primary instrument designed specifically to measure machine vibration in routine inspection practice. Therefore, the best answer is Vibration Meter, because it directly measures the mechanical oscillatory behavior of equipment.

NEW QUESTION # 99

Final inspection and shipping preparations of switchgear typically consists of verifying all of the following except:

- A. all final manufacturing and drawing issues are closed.
- B. correct engraving of unit and master nameplates.

- C. all items on the manufacturer's QC checkout are signed off.
- D. visual inspection of packaging requirements.

Answer: A

Explanation:

The correct answer is A because final inspection and shipping preparation for switchgear normally focuses on the equipment's physical readiness for release, not on closing every remaining manufacturing or drawing-administration issue in a broad project sense. At this stage, the source inspector typically verifies that the assembled lineup is complete, that unit and master nameplates are correctly engraved, that preservation and packaging requirements have been visually checked, and that the manufacturer's QC checkout or final release checklist has been properly completed and signed. These are direct shipment-readiness verification points.

By contrast, "all final manufacturing and drawing issues are closed" is broader and more administrative.

Some drawing comments, document revisions, or non-shipment-related internal matters may still be processed separately through document control without preventing the practical completion of shipping inspection, as long as the equipment itself is acceptable for release and traceable records support that release. The API guide treats switchgear as a covered equipment category and emphasizes source inspection and quality surveillance activities such as verifying conformance to specifications, records, markings, and inspection status rather than acting as the project's full document-closeout authority.
