Three in Demand CompTIA DS0-001 Exam Questions Formats

Three DS0-001 exam questions formats that we have are CompTIA DataSys+ Certification Exam (DS0-001) dumps PDF format, web-based DS0-001 practice exam and desktop-based DS0-001 practice test software. Our CompTIA DS0-001 PDF dumps

format has actual DS0-001 Questions which are printable and portable. Hence, you can go through these DS0-001 questions via your smart devices like smartphones, laptops, and tablets.

CompTIA DataSys+ Certification Exam Sample Questions (Q88-Q93):

NEW QUESTION # 88

Given the following customer table:

ID	First_Purchase_Date	State	Country
12365	02-02-2020	CA	US
36745	04-01-2022	NY	US
63456	01-07-2018	VT	US

Which of the following ORM snippets would return the ID, state, and country of all customers with the newest customers appearing first?

- A.

```
result = session.execute(  
    select(Customer.ID, Customer.State, Customer.Country)  
)
```

- B.

```
result = session.execute(  
    select(Customer.ID, Customer.State, Customer.Country).  
        .order_by(Customer.First_Purchase_Date.asc())  
)
```

```
result = session.execute(  
    select(Customer.ID, Customer.State, Customer.Country).  
        .order_by(Customer.First_Purchase_Date.desc())  
)
```

- C.

```
result = session.execute(  
    select(Customer.ID, Customer.State, Customer.Country).  
        .order_by(Customer.First_Purchase_Date)  
)
```

- D.

Answer: A

Explanation:

The ORM snippet that would return the ID, state, and country of all customers with the newest customers appearing first is option C. This snippet uses the select method to specify the columns to be returned, the order method to sort the results by ID in descending order, and the all method to fetch all the records. The other options either have syntax errors, use incorrect methods, or do not sort the results correctly.

NEW QUESTION # 89

Which of the following best describes the category of SQL commands required to revoke access to database objects?

- A. TCL
- B. DDL
- C. DCL
- D. DML

Answer: B

Explanation:

The category of SQL commands that is required to revoke access to database objects is DCL.

DCL, or Data Control Language, is a subset of SQL commands that are used to control or manage the access or permissions of users or roles on a database. DCL includes commands such as GRANT and REVOKE.

GRANT is a DCL command that is used to grant privileges or roles to users or roles on specific objects in a database, such as tables, views, procedures, etc. REVOKE is a DCL command that is used to revoke privileges or roles from users or roles on specific objects in a database. For example, the following statement uses the REVOKE command to revoke the SELECT privilege from user Alice on table employee:

```
REVOKE SELECT ON employee FROM Alice
```

NEW QUESTION # 90

Which of the following describes a lock that allows concurrent transactions to access different records of the same table?

- A. Row-level lock
- B. Page-level lock
- C. Table-level lock
- D. Database-level lock

Answer: A

Explanation:

A row-level lock permits multiple transactions to access different rows within the same table concurrently, improving concurrency and minimizing contention.

NEW QUESTION # 91

(Which of the following are logical infrastructure security measures? Select two.)

- A. Firewall
- B. Time locks
- C. Strong passwords
- D. Port security
- E. Camera systems
- F. Key cards

Answer: A,C

Explanation:

The correct answers are A. Firewall and C. Strong passwords. CompTIA DataSys+ differentiates security controls into logical (technical) and physical infrastructure security measures. Logical security measures are implemented through software, configuration, and system controls to protect data, systems, and network resources from unauthorized access or misuse.

A firewall is a core logical infrastructure security control. It enforces security rules that regulate incoming and outgoing network traffic based on predefined policies. In database environments, firewalls are used to restrict access to database servers, limit exposed ports, and allow connections only from trusted IP addresses or networks. DataSys+ emphasizes firewalls as a first line of defense in protecting databases from unauthorized access and network-based attacks.

Strong passwords are another essential logical security measure. They are part of authentication controls that ensure only authorized users can access systems and databases. Strong password requirements—such as minimum length, complexity, expiration, and reuse restrictions—help mitigate attacks like brute-force attempts, credential stuffing, and unauthorized privilege escalation. DataSys+ highlights strong authentication controls as foundational to protecting database environments.

Option D, port security, can be ambiguous, but in CompTIA context it is often associated with network switch configurations and is more infrastructure-specific; however, the exam most clearly classifies firewall and authentication mechanisms as logical controls.

Options C, E, and F—key cards, camera systems, and time locks—are all physical security controls. These protect the physical facility or hardware but do not directly enforce access through software or system logic.

CompTIA DataSys+ stresses a layered security approach, where logical controls protect data and systems, while physical controls protect facilities. In this question, the focus is explicitly on logical infrastructure security, making Firewall and Strong passwords the most accurate and clearly aligned answers.

Therefore, the correct selections are A and C.

NEW QUESTION # 92

A server administrator wants to analyze a database server's disk throughput. Which of the following should the administrator measure?

- **A. IOPS**
- B. Latency
- C. RPI
- D. Reads

Answer: A

Explanation:

The factor that the administrator should measure to analyze a database server's disk throughput is IOPS.

IOPS, or Input/Output Operations Per Second, is a metric that measures the number of read and write operations that a disk can perform in one second. IOPS indicates the performance or speed of a disk and how well it can handle multiple requests or transactions. Higher IOPS means higher disk throughput and lower latency. IOPS can be affected by various factors, such as disk type, size, speed, cache, RAID level, etc. The other options are either not related or not sufficient for this purpose. For example, RPI is not a valid acronym or metric; latency is the time delay between a request and a response; reads are the number of read operations performed by a disk.
