NEW QUESTION # 156
An engineer completed the basic installation for two Cisco CMX servers and is in the process of configuring high availability, but it fails.
Which two statements about the root of the issue are true? (Choose two.)

- A. The Cisco CMX instances are installed in the same subnet.
- B. The sizes of the primary and secondary Cisco CMX installations differ.
- C. Both Cisco CMX installations are virtual.
- D. The types of the primary and secondary Cisco CMX installations differ.
- E. The delay between the primary and secondary instance is 200 ms.

Answer: B,D

Explanation:
Pre-requisites for HA
Both the primary and the secondary server should be of the same size and the same type (VM or physical appliance).
Both the primary and the secondary server should have the same Cisco CMX version.
Both the primary and the secondary server should be connected on the same subnet.
Both the primary and the secondary server should be connected on the same subnet if Layer 2 HA is required.
Both the primary and the secondary server should be IP connected with delay of less then 250ms if Layer 3 HA is used.
From Cisco CMX release 10.6.2, NTP server settings must be configured on both Primary and Secondary server instance before HA pairing starts. We recommend that you use the same NTP server on both Primary and Secondary. As a Cisco CMX admin you can also use a dedicated NTP for Primary and Secondary.

NEW QUESTION # 158
A corporation has a wireless network where all access points are configured in FlexConnect. The WLC has a Data WLAN and a VoWiFi WLAN implemented where centrally-switched SSID is configured for the APs.

Which QoS configuration must be implemented for the wireless packets to maintain the marking across the wired and wireless network?

- A. Enable CAC.
- B. Set QoS to Platinum.
- C. Allow WMM.
- D. Trust DSCP.

Answer: D

Explanation:
Trusting DSCP is essential for maintaining the QoS markings across the wired and wireless network in a FlexConnect deployment. By trusting DSCP, the WLC and APs will preserve the QoS markings set by applications and devices, ensuring consistent QoS treatment throughout the network.
