Exam Nutanix NCP-MCA Tests, NCP-MCA Passing Score Feedback

With the society of development, companies have high demands for IT senior positions, how do applicants stand out over so many competes? Nutanix NCP-MCA latest exam cram make you stand out. Our exam cram materials help thousands of candidates pass exam and get certifications. Many companies cooperate with us long-term to provide valid NCP-MCA Latest Exam Cram for their engineers and managers since they find our materials are the best provider.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA) exam is a validation of skills and expertise in deploying and managing Nutanix clusters and automating tasks with Nutanix automation features. NCP-MCA Exam is designed to test the knowledge and skills of IT professionals who work with Nutanix technology, including administrators, engineers, and architects. Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) certification provides a solid foundation for professionals who want to advance their careers and stay up-to-date with the latest Nutanix technologies.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q40-Q45):

NEW QUESTION # 40

An administrator is manually performing the following post-deployment steps each time a VM is provisioned using a Self-Service blueprint:

- * Tagging the VM with environment and owner information
- * Adding the VM to the monitoring system
- * Sending an email notification to the requesting user

The administrator wants to automate this process to reduce manual effort and ensure consistency.

Which action should the administrator take to automate this manual process?

- A. Modify the blueprint's VM definition to include metadata fields and instruct users to manually perform the post-deployment tasks.
- B. Add custom scripts to the VM template in Prism Element and reboot the VM.
- C. Assign Calm Admin permissions to the users so they can edit the deployed VMs and configure automation scripts.
- **D. Update the blueprint to include the required tasks within the Create substrate.**

Answer: D

Explanation:

To automate post-deployment configuration within Nutanix Self-Service (Calm), the administrator must define Tasks within the Service lifecycle of the Blueprint.

* Service Lifecycle: Every Service (VM) in a blueprint has lifecycle actions, such as Create, Start, Stop, and Delete.

* Automation Implementation: The administrator should add specific tasks (e.g., HTTP tasks for API calls to monitoring, Scripts for tagging/email) specifically to the Create action (or Package Install phase) of the Service.

* Execution: When the blueprint is launched, the Orchestrator provisions the VM (Substrate) and then automatically executes these defined tasks in sequence. This ensures that tagging, monitoring, and notification happen immediately and consistently for every deployment without manual intervention.

NEW QUESTION # 41

Refer to the exhibit.

The Playbook is designed to execute a script, in order to fix a known problem in the application. However, it keeps failing. Why is this Playbook continuing to fail?

- A. Not enough storage space in order to take a snapshot.
- **B. The Playbook actions are in the wrong order.**
- C. Slack configuration should be reviewed.
- D. The script is incorrect.

Answer: B

NEW QUESTION # 42

What is the correct method to upgrade Calm?

- **A. LCM via Prism Central**
- B. Calm Marketplace
- C. LCM via Prism Element
- D. Calm Dashboard

Answer: A

Explanation:

You can upgrade Nutanix Calm or Epsilon (the orchestration engine used by Nutanix Calm) by using the Life Cycle Manager (LCM) from the Prism Central. LCM allows you to upgrade Calm or Epsilon independently or simultaneously. You can also select the version that you want to upgrade to and perform the update from the Options list. For more information, see the Nutanix Calm Upgrades section in the Nutanix Calm Admin and Operations Guide¹ and the Performing Inventory and Upgrading Calm with Life Cycle Manager article². NEW QUESTION # 43

A developer is building and testing a new Blueprint to deploy a Windows Server VM on AHV. During one of the test runs, the application build fails.

The developer asks an administrator to investigate the failure. After careful review, the administrator finds this error message on a task that executes a PowerShell script.

What is the cause of this error message?

- A. CredSSP has not been enabled on the Windows Operating System.
- B. The Powershell script has an error in the code and cannot be executed as designed.
- C. The version of PowerShell is incorrect.
- D. Self-Service cannot communicate with the newly provisioned VM.

Answer: A

Explanation:

The error message "A specified logon session does not exist. It may already have been terminated" is often caused by the lack of CredSSP (Credential Security Support Provider) being enabled on the Windows Operating System. CredSSP is necessary for certain remote operations, including executing PowerShell scripts remotely.

References:

* Microsoft documentation on Enabling CredSSP.

* Nutanix documentation on Troubleshooting PowerShell Scripts.

NEW QUESTION # 44

Which permission level grants access to Create, Update, Delete, and Duplicate Blueprints?

- A. Domain Admin
- B. Operator
- C. Consumer
- D. Developer

Answer: D

Explanation:

A Developer permission level grants access to create, update, delete, and duplicate blueprints in Nutanix Calm12. A Developer can also launch, manage, and delete applications from blueprints, as well as create, update, delete, and duplicate runbooks2. A Consumer can only launch and manage applications from blueprints, but cannot modify them2. An Operator can launch, manage, and delete applications from blueprints, as well as run and manage runbooks, but cannot create or modify them2. A Domain Admin can perform all the actions of a Developer and an Operator, as well as manage projects, categories, and endpoints2. References:
