If you take a little snack, you will find that young people are now different. They made higher demands on themselves. This is a change in one's own mentality and it is also a requirement of the times! Whether you want it or not, you must start working hard! And our ISTQB-CTFL exam materials may slightly reduce your stress. With our ISTQB-CTFL study braidumps for 20 to 30 hours, we can proudly claim that you can pass the exam easily just as a piece of cake. And as long as you try our ISTQB-CTFL practice questions, you will love it!

At Actual4test, we offer a ISTQB-CTFL dumps PDF, desktop ISTQB ISTQB-CTFL practice test software, and a web-based practice exam which is specifically designed to help you prepare for your ISTQB ISTQB-CTFL Certification Exam. Whether you are looking for real ISTQB ISTQB-CTFL dumps pdf file or practice exams to help you master the ISTQB ISTQB-CTFL exam, we have got you covered.

Exam ISTQB-CTFL Quiz | ISTQB-CTFL Exam Reviews

The only aim of our company is to help each customer pass their exam as well as getting the important certification in a short time. If

you want to pass your exam and get the ISTQB-CTFL certification which is crucial for you successfully, I highly recommend that you should choose the ISTQB-CTFL certification braindumps from our company so that you can get a good understanding of the exam that you are going to prepare for. We believe that if you decide to buy the ISTQB-CTFL Exam Materials from our company, you will pass your exam and get the certification in a more relaxed way than other people.

ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q96-Q101):

NEW QUESTION # 96

Which of the following sentences describe a product risk?

- A. A wrong configuration of the test environment that causes incidents related to the environment and not to the software under test
- **B. The application might not be able to provide the expected responsiveness under a load of up-to 300 concurrent users**
- C. The development team lacks knowledge of the technology on which the product is based
- D. Failure in acquiring an adequate and test automation tool

Answer: B

Explanation:

This question relates to identifying product risks, which are potential problems associated with the product itself, such as software functionality, reliability, usability, and performance. Option A describes a scenario where the application might not meet performance requirements under specific conditions (up to 300 concurrent users), which directly impacts the product's ability to perform its intended function. This is a classic example of a product risk, as it concerns the product's quality and its ability to meet user needs. Options B, C, and D, on the other hand, relate to project risks, which are concerns related to the management and execution of the project, such as tool acquisition, environment configuration, and team expertise, rather than the quality of the product itself.

NEW QUESTION # 97

Which of the following can be considered a VALID exit criterion?

- I Estimates of defect density or reliability measures.
- II. The completion and publication of an exhaustive Test Report.
- III. Accuracy measures, such as code, functionality or risk coverage.
- IV Residual risks such as lack of code coverage in certain areas.

- **A. I, III, IV**
- B. I, II, III
- C. III, IV
- D. II, III, IV

Answer: A

Explanation:

An exit criterion is a condition that defines when a test activity has been completed or when a test phase can be concluded. An exit criterion can be based on various factors, such as:

* I) Estimates of defect density or reliability measures. These are quantitative measures that indicate how many defects are present in the software product or how likely it is to fail under certain conditions.

These can be used as exit criteria to ensure that the software product meets a certain level of quality or performance before moving to the next phase or releasing it to the customer.

* III) Accuracy measures, such as code coverage, functionality coverage or risk coverage. These are quantitative measures that indicate how much of the software product has been tested in terms of its code, functionality or risk. These can be used as exit criteria to ensure that the test suite is adequate or complete before moving to the next phase or releasing it to the customer.

* IV) Residual risks, such as lack of code coverage in certain areas, unresolved defects or unknown factors. These are qualitative measures that indicate the remaining risks or uncertainties associated with the software product after testing. These can be used as exit criteria to ensure that the residual risks are acceptable or manageable before moving to the next phase or releasing it to the customer. The following factor is not a valid exit criterion:

* II) The completion and publication of an exhaustive Test Report. This is not a valid exit criterion, as it does not reflect the quality or completeness of the testing process or product. A test report is a document that summarizes the results and outcomes of a test activity or phase. A test report can be used as an input for deciding whether to exit a test activity or phase, but it is not a condition that defines when to exit. NEW QUESTION # 98

Which of the following work products cannot be examined by static analysis?

- A. Formal models
- B. Source code
- C. Test plans
- D. Compiled code

Answer: C

Explanation:

Static analysis is the process of examining the work products of a software development or testing activity without executing them. Static analysis can be applied to various types of work products, such as requirements, design, code, test cases, etc. However, test plans are not suitable for static analysis, because they are high-level documents that describe the test objectives, scope, strategy, resources, schedule, and risks of a testing project. Test plans are not executable or formalized in a way that static analysis tools can analyze them. Therefore, option A is the correct answer.

ISTQB Certified Tester Foundation Level Syllabus v4.01, Section 2.2.1, page 20; ISTQB Glossary v4.02, page 45.

NEW QUESTION # 99

Which of the following statements about the testing quadrants is TRUE?

- A. Exploratory tests are classified in quadrant Q3, and they are usually included in a continuous integration process.
- B. Automated acceptance tests produced during BDD and ATDD are classified in quadrant Q2.
- C. Automated unit tests produced during TDD are classified in quadrant Q4 as they are technology facing.
- D. The higher the number of the testing quadrant, the more important the tests associated with this quadrant are

Answer: B

Explanation:

The correct statement is B. According to the ISTQB CTFL syllabus, the testing quadrants help to categorize tests based on their purpose and whether they are technology-facing or business-facing, and whether they support the team or critique the product. Quadrant Q2 includes tests that are business-facing and support the team, such as automated acceptance tests produced during Behavior-Driven Development (BDD) and Acceptance Test-Driven Development (ATDD).

Quadrant Q3 includes business-facing tests that critique the product, such as exploratory testing, usability testing, and user acceptance testing. These tests are typically manual and focus on evaluating the product from a user perspective, rather than being part of a continuous integration process.

Quadrant Q4 includes technology-facing tests that critique the product, such as performance tests, security tests, and other non-functional tests, which can be automated but are not related to unit tests produced during TDD.

NEW QUESTION # 100

The following rules determine the annual bonus to be paid to a salesman of a company based on the total annual amount of the sales made (referred to as TAS).

If the TAS is between 50k€ and 80k€, the bonus is 10%. If the TAS exceeds 80k€ by a value not greater than 40k€, the bonus is 15%. Finally, if the TAS

exceeds the maximum threshold which entitles to a 15% bonus, the bonus is 22%.

Consider applying equivalence partitioning to the TAS (Note: 1k€ = 1000 euros).

Which one of the following answers contain only test cases that belong to the same equivalence partition?

- A. TC1 = 81 k€; TC2= 97k€; TC3=111k€; TC4=118k€
- B. TC1 = 90k€; TC2= 110k€; TC3=125k€; TC4=140k€
- C. TC1 = 79k€; TC2= 80k€; TC3=81k€; TC4=82k€
- D. TC1 = 40k€; TC2= 46k€; TC3=51k€; TC4=53k€

Answer: A

Explanation:

This answer is correct because equivalence partitioning is a test design technique that divides the input domain of a system or

component into partitions of equivalent data, such that each partition is expected to produce the same output or behavior. Equivalence partitioning aims to reduce the number of test cases by selecting one representative value from each partition. In this case, the input domain of the TAS can be divided into four partitions based on the bonus rules: less than 50k€, between 50k€ and 80k€, between 80k€ and 120k€, and more than 120k€. The test cases in the answer belong to the same partition, which is between 80k€ and 120k€, and they are expected to produce the same output, which is a bonus of 15%.
