Exam EMC D-PWF-OE-00 Introduction, D-PWF-OE-00 Exam Dumps Provider

A person's career prospects are often linked to his abilities, so an international and authoritative certificate is the best proof of one's ability. The D-PWF-OE-00 exam certification is a proof of your IT ability. To pass this exam also needs a lot of preparation. The D-PWF-OE-00 Exam Materials provided by Actualtests4sure are collected and sorted out by experienced team. Now you can have these precious materials. You can safely buy a full set of D-PWF-OE-00 exam software in our official website.

EMC Dell PowerFlex Operate Exam Sample Questions (Q63-Q68):

NEW QUESTION # 63

What is the primary purpose of enabling Maintenance Mode on a PowerFlex node?

- A. To add new nodes to the cluster
- B. To protect volumes using snapshots
- C. To isolate the node for network troubleshooting without impacting data availability
- **D. To perform software upgrades or hardware maintenance**

Answer: D

Explanation:

In Dell PowerFlex, Maintenance Mode is a critical operational state used primarily when a node requires software upgrades, firmware patches, or physical hardware replacement. When a Storage Data Server (SDS) requires maintenance, it cannot simply be powered down, as this would cause a rebuild of data to restore redundancy, placing immense stress on the cluster.

There are two types of maintenance modes:

* Protected Maintenance Mode (PMM): This is the standard method for planned maintenance. The system identifies the data residing on the target node and makes a temporary copy (mesh-mirrors) of that data onto other nodes in the cluster before the node enters maintenance. This ensures that the cluster maintains full data protection (usually 2 copies) even while the node is offline.

* Instant Maintenance Mode (IMM): This is used when time is critical, or the node is already offline. It acknowledges the node is

down but does not trigger a full rebuild immediately, relying on the remaining copy of data.

Therefore, the specific purpose is to allow administrators to perform necessary software upgrades or hardware swaps in a controlled manner that manages data integrity and prevents unnecessary "storm" traffic from rebuilding data.

NEW QUESTION # 64

What tasks are automated during a PowerFlex upgrade using PowerFlex Manager? (Choose two).

- A. Node-by-node upgrade process
- B. Monitoring upgrade progress
- C. Rebalancing storage pools
- D. Resolving fault tolerance issues

Answer: A,B

Explanation:

PowerFlex Manager (PFxM) orchestrates the Lifecycle Management (LCM).

* Node-by-node upgrade process (Option A): PFXM automates the tedious sequence: Enter Maintenance Mode Node 1 -> Wait for sync -> Upgrade OS/Firmware/SDS -> Reboot -> Exit Maintenance Mode -> Verify Health -> Move to Node 2.

* Monitoring upgrade progress (Option C): PFXM provides a consolidated view of this process. It tracks the status of the job, the percentage complete, and the specific step (e.g., "Flashing BIOS" or "Waiting for Rebalance").

Note: Rebalancing (B) is a native function of the MDM/SDS that happens automatically; PFXM waits for it, but the MDM performs it.

NEW QUESTION # 65

What is the default state of snapshots created in PowerFlex?

- A. Archived
- B. Read-only
- C. Editable
- D. Active

Answer: C

Explanation:

* Editable (Writable): Unlike many traditional storage arrays where a snapshot is a read-only frozen image requiring a "clone" to become writable, PowerFlex snapshots are fully writable volumes by default.

* Behavior: Immediately upon creation, a snapshot is mapped as a volume. You can mount it to a host, write new data to it, delete files from it, or format it, without affecting the source parent volume (due to the Redirect-on-Write architecture).

NEW QUESTION # 66

Which software components are essential for PowerFlex operations? (Choose two).

- A. VMware Horizon
- B. Storage Data Server (SDS)
- C. PowerProtect Data Manager
- D. Meta Data Manager (MDM)

Answer: B,D

Explanation:

This question asks for the core components that make up the PowerFlex software-defined storage system.

* Meta Data Manager (MDM) (Option B): The MDM is the control plane. It manages the mapping of data, monitors the state of the system, controls rebuilds/rebalances, and acts as the central point for configuration. Without the MDM, the cluster cannot function or change state.

* Storage Data Server (SDS) (Option A): The SDS is the data plane. It is the software installed on every node that contributes storage. It abstracts the local drives, performs I/O operations, and communicates with other SDSs to replicate data.

Incorrect Options: VMware Horizon (C) is VDI software that uses PowerFlex, but is not part of it.

PowerProtect (D) is backup software.

NEW QUESTION # 67

What happens to active workloads during a PowerFlex upgrade?

- A. They are migrated to another cluster
- B. They are backed up and restored post-upgrade
- C. They continue running without disruption
- D. They are suspended until the upgrade is complete

Answer: C

Explanation:

PowerFlex is architected specifically for Non-Disruptive Upgrades (NDU).

* Continuous Operation (Option C): Active workloads (databases, VMs, containers) continue to run and process I/O throughout the entire upgrade process.

* How it works: When a node (SDS) needs to be upgraded, it is placed into Maintenance Mode. The system ensures that the data on that node is mirrored elsewhere or accessible from the secondary copy.

The SDC (client driver) on the application hosts automatically redirects I/O to the remaining healthy nodes. Once the node is upgraded and rebooted, it rejoins the cluster, and the SDC resumes sending I/O to it. This transparency ensures that applications experience zero downtime.
