XK0-005 exam dumps & XK0-005 torrent pdf & XK0-005 training guide

It is really not easy to pass XK0-005 exam, but once you get the exam certification, it is not only a proof of your ability, but also an internationally recognised passport for you. You cannot blindly prepare for XK0-005 exam. Our Dumpcollection technical team have developed the XK0-005 Exam Review materials in accordance with the memory learning design concept, which will relieve your pressure from the preparation for XK0-005 exam with scientific methods.

CompTIA Linux+ Certification Exam Sample Questions (Q20-Q25):

NEW QUESTION # 20

A Linux administrator is creating a primary partition on the replacement hard drive for an application server. Which of the following commands should the administrator issue to verify the device name of this partition?

- A. sudo fdisk /dev/sda
- B. sudo fdisk -l
- C. sudo fdisk -h
- D. sudo fdisk -s /dev/sda

Answer: B

NEW QUESTION # 21

A systems administrator installed a new software program on a Linux server. When the systems administrator tries to run the program, the following message appears on the screen.

Which of the following commands will allow the systems administrator to check whether the system supports virtualization?

- A. dmidecode -s system-version
- B. sysctl -a
- C. lscpu
- D. cat /sys/device/system/cpu/possible

Answer: C

Explanation:
Explanation
The command that will allow the systems administrator to check whether the system supports virtualization is lscpu. This command will display information about the CPU architecture, such as the number of CPUs, cores, sockets, threads, model name, frequency, cache size, and flags. One of the flags is vmx (for Intel processors) or svm (for AMD processors), which indicates that the CPU supports hardware virtualization. If the flag is present, it means that the system supports virtualization. If the flag is absent, it means that the system does not support virtualization or that it is disabled in the BIOS settings.
The other options are not correct commands for checking whether the system supports virtualization. The dmidecode -s system-version command will display the version of the system, such as the product name or serial number, but not the CPU information. The sysctl -a command will display all the kernel parameters, but not the CPU flags. The cat /sys/devices/system/cpu/possible command will display the range of possible CPUs that can be online or offline, but not the CPU features. References: lscpu(1) - Linux manual page; How To Check If Virtualization is Enabled in Windows 10 / 11

NEW QUESTION # 22

A Linux user reported the following error after trying to connect to the system remotely:
ssh: connect to host 10.0.1.10 port 22: Resource temporarily unavailable The Linux systems administrator executed the following commands in the Linux system while trying to diagnose this issue:

```
# netstat -an | grep 22 | grep LISTEN
tcp       0        0      0.0.0.0:22        0.0.0.0:*        LISTEN

# firewall-cmd --list-all
public (active)
  target: default
  icmp-block-inversion: no
  interfaces: eth0
  sources:
  services: dhcpv6-client
  ports:
  protocols:
  masquerade: no
          forward-ports:
          source-ports:
          icmp-blocks:
          rich rules:
```

Which of the following commands will resolve this issue?

- A. firewall-cmd --zone=public --permanent --add-service=22
- B. firewall-cmd --zone=public --permanent --add-port=22/udp
- C. systemctl enable firewalld; systemctl restart firewalld
- D. firewall-cmd --zone=public --permanent --add-service=ssh

Answer: D

NEW QUESTION # 23
An administrator receives a warning about a file system filling up, and then identifies a large file located at /tmp/largelogfile. The administrator deletes the file, but no space is recovered on the file system.
Which of the following commands would BEST assists the administrator in identifying the problem?

- A. lsof | grep largelogfile
- B. pkill /tmp/largelogfile
- C. pgrep largelogfile
- D. ps -ef | grep largelogfile

Answer: A

Explanation:
https://access.redhat.com/solutions/2316

NEW QUESTION # 24
After starting an Apache web server, the administrator receives the following error:
Apr 23 localhost.localdomain httpd 4618] : (98) Address already in use: AH00072: make_sock: could not bind to address [: :]80
Which of the following commands should the administrator use to further trou-bleshoot this issue?

- A. Nc
- B. Ss
- C. Dig
- D. Ip

Answer: B

Explanation:
The ss command is used to display information about socket connections, such as the port number, state, and process ID. The error message indicates that the port 80 is already in use by another process, which prevents the Apache web server from binding to it. By using the ss command with the -l and -n options, the administrator can list all the listening sockets and their port numbers in numeric form, and identify which process is using the port 80. For example: ss -ln | grep :80. The ip, dig, and nc commands are not relevant for this issue, as they are used for different purposes, such as configuring network interfaces, querying DNS records, and testing network connectivity.

NEW QUESTION # 25
......

For candidates who have little time to prepare for the exam, our XK0-005 exam dumps will be your best choice. With experienced professionals to edit, XK0-005 training materials are high-quality, they have covered most of knowledge points for the exam, if you choose, you can improve your efficiency. In addition, we have a professional team to collect and research the latest information for the XK0-005 Exam Materials. Free update for one year is available, and the update version for XK0-005 material will be sent to your email automatically.
