ECCouncil Certified Ethical Hacker Exam (CEHv13) Sample Questions (Q652-Q657):

NEW QUESTION # 652

There are multiple cloud deployment options depending on how isolated a customer's resources are from those of other customers. Shared environments share the costs and allow each customer to enjoy lower operations expenses. One solution is for a customer to join with a group of users or organizations to share a cloud environment. What is this cloud deployment option called?

- A. Community
- B. Hybrid
- C. Public

- D. Private

Answer: A

Explanation:

The purpose of this idea is to permit multiple customers to figure on joint projects and applications that belong to the community, where it's necessary to possess a centralized clouds infrastructure. In other words, Community Cloud may be a distributed infrastructure that solves the precise problems with business sectors by integrating the services provided by differing types of clouds solutions.

The communities involved in these projects, like tenders, business organizations, and research companies, specialise in similar issues in their cloud interactions. Their shared interests may include concepts and policies associated with security and compliance considerations, and therefore the goals of the project also .

Community Cloud computing facilitates its users to spot and analyze their business demands better.

Community Clouds could also be hosted during a data center, owned by one among the tenants, or by a third- party cloud services provider and may be either on-site or off-site.

Community Cloud Examples and Use Cases

Cloud providers have developed Community Cloud offerings, and a few organizations are already seeing the advantages . the subsequent list shows a number of the most scenarios of the Community Cloud model that's beneficial to the participating organizations.

* Multiple governmental departments that perform transactions with each other can have their processing systems on shared infrastructure. This setup makes it cost-effective to the tenants, and may also reduce their data traffic.

Benefits of Community Clouds

Community Cloud provides benefits to organizations within the community, individually also as collectively.

Organizations don't need to worry about the safety concerns linked with Public Cloud due to the closed user group.

This recent cloud computing model has great potential for businesses seeking cost-effective cloud services to collaborate on joint projects, because it comes with multiple advantages.

Openness and Impartiality

Community Clouds are open systems, and that they remove the dependency organizations wear cloud service providers.

Organizations are able to do many benefits while avoiding the disadvantages of both public and personal clouds.

Flexibility and Scalability

* Ensures compatibility among each of its users, allowing them to switch properties consistent with their individual use cases. They also enable companies to interact with their remote employees and support the utilization of various devices, be it a smartphone or a tablet. This makes this sort of cloud solution more flexible to users' demands.

* Consists of a community of users and, as such, is scalable in several aspects like hardware resources, services, and manpower. It takes under consideration demand growth, and you simply need to increase the user-base.

High Availability and Reliability

Your cloud service must be ready to make sure the availability of knowledge and applications in the least times. Community Clouds secure your data within the same way as the other cloud service, by replicating data and applications in multiple secure locations to guard them from unforeseen circumstances.

Cloud possesses redundant infrastructure to form sure data is out there whenever and wherever you would like it. High availability and reliability are critical concerns for any sort of cloud solution.

Security and Compliance

Two significant concerns discussed when organizations believe cloud computing are data security and compliance with relevant regulatory authorities. Compromising each other's data security isn't profitable to anyone during a Community Cloud.

Users can configure various levels of security for his or her data. Common use cases:

* the power to dam users from editing and downloading specific datasets.

* Making sensitive data subject to strict regulations on who has access to Sharing sensitive data unique to a specific organization would bring harm to all or any the members involved.

* What devices can store sensitive data.

Convenience and Control

Conflicts associated with convenience and control don't arise during a Community Cloud. Democracy may be a crucial factor the Community Cloud offers as all tenants share and own the infrastructure and make decisions collaboratively. This setup allows organizations to possess their data closer to them while avoiding the complexities of a personal Cloud.

Less Work for the IT Department

Having data, applications, and systems within the cloud means you are doing not need to manage them entirely. This convenience eliminates the necessity for tenants to use extra human resources to manage the system. Even during a self-managed solution, the work is split among the participating organizations.

Environment Sustainability

In the Community Cloud, organizations use one platform for all their needs, which dissuades them from investing in separate cloud facilities. This shift introduces a symbiotic relationship between broadening and shrinking the utilization of cloud among clients. With the reduction of organizations using different clouds, resources are used more efficiently, thus resulting in a smaller carbon footprint.

NEW QUESTION # 653

ping - * 6 192.168.0.101

Output:

Pinging 192.168.0.101 with 32 bytes of data:

Reply from 192.168.0.101: bytes=32 time<1ms TTL=128

...

Packets: Sent = 6, Received = 6, Lost = 0 (0% loss)

What does the option * indicate?

- A. s
- B. t
- C. n
- D. a

Answer: B

Explanation:

While the question as shown appears slightly misformatted, this closely resembles the Windows command:

ping -t 192.168.0.101

Here:

-t means to ping continuously until manually stopped.

In the question: ping -* 6 192.168.0.101, the * is most likely a placeholder or typographical error. Based on CEH format questions and how command-line flags work in ping, -t is the correct flag.

Option A. t - Correct (ping continuously)

Why Others Are Incorrect:

B). s: Not a valid option in Windows ping.

C). a: Used to resolve the hostname from an IP (not related to this).

D). n: Specifies the number of echo requests to send.

NEW QUESTION # 654

An attacker places a malicious VM on the same physical server as a target VM in a multi-tenant cloud environment. The attacker then extracts cryptographic keys using CPU timing analysis. What type of attack was conducted?

- A. Metadata spoofing
- B. Cache poisoned denial of service (CPDoS)
- C. Cloud cryptojacking
- D. Side-channel attack

Answer: D

Explanation:

CEH cloud modules explain that side-channel attacks exploit indirect information leakage based on hardware characteristics-such as CPU timing, power usage, cache access patterns, or electromagnetic emissions. In virtualized cloud environments, multiple tenants share the same physical hardware, creating opportunities for attackers to extract sensitive data from neighboring virtual machines. By placing a malicious VM on the same host as the victim, an attacker can measure minute differences in timing during cryptographic operations, allowing them to infer private keys or sensitive computations. This aligns precisely with CEH's definition of a side-channel attack. Cryptojacking involves unauthorized cryptocurrency mining, CPDoS targets caching layers rather than key extraction, and metadata spoofing manipulates cloud metadata endpoints. Only side- channel analysis matches the described attack behavior.

NEW QUESTION # 655

A penetration tester identifies malware that monitors the activities of a user and secretly collects personal information, such as login credentials and browsing habits. What type of malware is this?

- A. Worm

- B. Spyware
- C. Ransomware
- D. Rootkit

Answer: B

Explanation:

CEH defines spyware as malware designed to covertly observe user behavior and transmit sensitive information to attackers without the victim's knowledge. Spyware commonly records keystrokes, browser activity, form submissions, application usage, and other personally identifiable information. CEH highlights that spyware often operates silently and may disguise itself as legitimate software, making detection difficult.

Unlike rootkits—which hide processes and files—or worms that self-replicate, spyware focuses exclusively on monitoring and data exfiltration. It is frequently installed through phishing, drive-by downloads, browser vulnerabilities, or malicious installers. Spyware can serve as a stepping stone for further system compromise by providing attackers with credentials for privilege escalation, lateral movement, or financial theft. CEH emphasizes the need for endpoint hardening, updated anti-malware engines, and behavioral analysis tools to detect such stealthy monitoring programs.

NEW QUESTION # 656

Which Nmap switch helps evade IDS or firewalls?

- A. -ON/-OX/-0G
- B. -D
- C. -n/-R
- D. -T

Answer: B

Explanation:

In CEH v13 Module 03: Scanning Networks, Nmap's evasion techniques are discussed for bypassing or confusing Intrusion Detection Systems (IDS) and firewalls.

The -D option in Nmap is used to enable decoy scanning. It inserts false IP addresses in the scan to obfuscate the true origin of the scan.

This technique helps in masking the attacker's IP and can confuse IDS logs.

Option Clarification:

- A). -n/-R: Disables DNS resolution (-n) or uses reverse DNS (-R), does not evade detection.
- B). -ON/-OX/-0G: Output formats (normal, XML, grepable), not related to evasion.
- C). -T: Controls timing (e.g., -T0 is stealthy, -T5 is aggressive), but not explicitly for IDS evasion.
- D). -D: Correct. Used for IDS/firewall evasion by using decoy IPs.
