

# EX380 Reliable Exam Camp & Latest EX380 Exam Answers

Many companies arrange applicants to take certification exams since 1995 internationally such like Microsoft, Fortinet, Veritas, EMC, and HP. RedHat EX380 exam sample online was produced in 2001 and popular in 2008. So far many companies built long-term cooperation with exam dumps providers. Many failure experiences tell them that purchasing a valid RedHat EX380 Exam Sample Online is the best effective and money-cost methods to achieve their goal.

## RedHat EX380 Exam Syllabus Topics:

| Topic   | Details  |
|---------|--|
| Topic 1 | <ul style="list-style-type: none"><li>• Manage workloads with cluster partitioning: Covers dedicating cluster nodes to specific workloads by configuring node pools, machine configurations, and special-purpose operators.</li></ul>  |
| Topic 2 | <ul style="list-style-type: none"><li>• Back up and restore applications with OpenShift API for Data Protection (OADP): Covers deploying OADP, performing full application backups including data and resources, using volume snapshots, and scheduling and restoring backups.</li></ul> |
| Topic 3 | <ul style="list-style-type: none"><li>• Configure and manage OpenShift Authentication and Identities: Covers integrating OpenShift with external identity providers like LDAP and Keycloak, managing RBAC, group synchronization, and kubeconfig-based authentication.</li></ul>         |
| Topic 4 | <ul style="list-style-type: none"><li>• Implement OpenShift GitOps: Covers deploying and configuring Argo CD with the GitOps operator to manage both cluster administration and application delivery through Git-based pipelines and integrations.</li></ul>                             |
| Topic 5 | <ul style="list-style-type: none"><li>• Manage cluster monitoring and metrics: Covers troubleshooting application and cluster performance issues and managing alerts and notifications.</li></ul>  |
| Topic 6 | <ul style="list-style-type: none"><li>• Provision and inspect cluster logging: Covers deploying and configuring OpenShift logging with Vector and Loki, forwarding logs externally, querying logs, and diagnosing logging issues.</li></ul>  |

## EX380 Reliable Exam Camp Exam Instant Download | Updated RedHat Latest EX380 Exam Answers

A good learning platform should not only have abundant learning resources, but the most intrinsic things are very important, and the most intuitive things to users are also indispensable. Imagine, if you're using a EX380 practice materials, always appear this or that grammar, spelling errors, such as this will not only greatly affect your mood, but also restricted your learning efficiency. Therefore, good typesetting is essential for a product, especially education products, and the EX380 test material can avoid these risks very

well.

## RedHat Red Hat Certified Specialist in OpenShift Automation and Integration Sample Questions (Q15-Q20):

### NEW QUESTION # 15

Kubeconfig Management - Use Context

#### Answer:

Explanation:

See the solution below in Explanation:

Explanation:

Step 1: Make sure the context already exists in the kubeconfig file.

This follows the context creation Task SIMULATION .

Step 2: Run the command:

```
oc config use-context audit --kubeconfig audit.config
```

Step 3: Confirm the active context switches successfully.

The lab output shows:

```
Switched to context "audit".
```

Detailed explanation:

This command activates the audit context inside the specified kubeconfig file. Once selected, subsequent oc commands using that kubeconfig will default to the cluster, user, and namespace associated with that context.

This is operationally important because many administration mistakes come from running commands against the wrong cluster or project. Using explicit context switching reduces that risk and makes the kubeconfig usable for the intended audit workflow. In exams and real environments alike, the context is what turns separate kubeconfig elements into a working session configuration. Without switching to the correct context, even a well-formed kubeconfig may not be used as expected.

### NEW QUESTION # 16

GitOps and MachineConfig - Trigger Argo CD Synchronization by Repository Update

#### Answer:

Explanation:

See the solution below in Explanation:

Explanation:

Step 1: Confirm that the repository being pushed to is the same repository watched by the GitOps/Argo CD application.

This linkage is essential because GitOps acts only on configured source repositories and paths.

Step 2: Commit the MachineConfig changes.

The lab uses:

```
git commit -am "Add MachineConfig for motd"
```

Step 3: Push the changes to the tracked branch.

The lab uses:

```
git push origin main
```

Step 4: Allow Argo CD to detect the repository change and begin synchronization.

In a standard GitOps model, the controller compares the Git repository to the cluster state and applies drift correction or new desired resources.

Detailed explanation:

This sub Task SIMULATION is the operational purpose behind the previous Git command Task SIMULATION . The point is not merely to store a file in Git; it is to update the declarative source that Argo CD uses to reconcile the cluster. Once the repository is updated, Argo CD detects the new commit and syncs the MachineConfig into the cluster according to its application definition. This demonstrates a core automation principle in OpenShift GitOps: administrators do not treat the cluster as the primary editable surface. Instead, they modify Git and let the automation layer enforce state. That provides traceability, peer review potential, rollback capability, and consistency across environments.

### NEW QUESTION # 17

Prevent workloads from running on dedicated nodes (taints)

Task Information : Apply a taint to dedicated nodes so only pods with tolerations can run there.

**Answer:**

Explanation:

See the solution below in Explanation:

Explanation:

- \* Taint nodes
- \* oc adm taint nodes worker-1 dedicated=payments:NoSchedule
- \* oc adm taint nodes worker-2 dedicated=payments:NoSchedule
- \* NoSchedule blocks new pods that do not tolerate the taint.
- \* Confirm taints
- \* oc describe node worker-1 | grep -i taints -A2
- \* Ensures taints are present.
- \* Validate effect
- \* A normal deployment without tolerations will remain Pending if it can only land on those tainted nodes.

**NEW QUESTION # 18**

Spread replicas using podAntiAffinity

Task Information : Configure payments/api to prefer scheduling pods on different nodes.

**Answer:**

Explanation:

See the solution below in Explanation:

Explanation:

- \* Patch deployment with preferred podAntiAffinity
- \* oc -n payments patch deploy api --type=merge -p '{
- \* "spec":{"template":{"spec":{"affinity":{"
- \* "podAntiAffinity":{"
- \* "preferredDuringSchedulingIgnoredDuringExecution":[{"
- \* "weight":100,
- \* "podAffinityTerm":{"
- \* "labelSelector":{"matchLabels":{"app":"api"}},
- \* "topologyKey":"kubernetes.io/hostname"
- \* }
- \* }]
- \* }
- \* }}}
- \* }'
- \* Encourages spread across nodes to reduce single-node impact.
- \* Verify spread
- \* oc -n payments get pods -o wide

**NEW QUESTION # 19**

Identity Management - Create CA ConfigMap

**Answer:**

Explanation:

See the solution below in Explanation:

Explanation:

Step 1: Ensure the certificate file rhds\_ca.crt is available in your current working directory or use the correct path.

The Task requires creating a configmap from this CA certificate file.

Step 2: Run the command:

oc create configmap rhds-ca-config-map --from-file ca.crt=rhds\_ca.crt -n openshift-config Step 3: Confirm the configmap is created.

The lab output shows:

configmap/rhds-ca-config-map created

Detailed explanation:

This creates a configmap named rhds-ca-config-map in the openshift-config namespace and maps the local file rhds\_ca.crt to the

key name ca.crt inside the configmap. This is important in external identity integration because OpenShift may need to trust a custom certificate authority when communicating with LDAP or another secured external service. By placing the certificate in a configmap, the authentication operator or related cluster configuration can reference it cleanly. The key name matters because many OpenShift resources expect a CA bundle key with a specific filename-like convention. If the file path is wrong, the command fails immediately. If the configmap name or key mapping is wrong, the authentication provider referencing it may not trust the external endpoint.

## NEW QUESTION # 20

.....

RedHat EX380 practice test software contains many RedHat EX380 practice exam designs just like the real Red Hat Certified Specialist in OpenShift Automation and Integration (EX380) exam. These EX380 practice exams contain all the EX380 questions that clearly and completely elaborate on the difficulties and hurdles you will face in the final EX380 Exam. Red Hat Certified Specialist in OpenShift Automation and Integration (EX380) practice test is customizable so that you can change the timings of each session. BraindumpQuiz desktop RedHat EX380 practice test questions software is only compatible with windows and easy to use for everyone.
