Test your knowledge of the CTAL-TAE exam dumps with DumpsReview ISTQB Certified Tester Advanced Level, Test Automation Engineering (CTAL-TAE) practice questions. The software is designed to help with ISTQB Certified Tester Advanced Level, Test Automation Engineering (CTAL-TAE) exam dumps preparation. ISTQB Certified Tester Advanced Level, Test Automation Engineering (CTAL-TAE) practice test software can be used on devices that range from mobile devices to desktop computers. We provide the ISTQB Certified Tester Advanced Level, Test Automation Engineering (CTAL-TAE) exam questions in a variety of formats, including a web-based practice test, desktop practice exam software, and downloadable PDF files.

The CTAL-TAE certification exam is ideal for software testers who have at least three years of experience in software testing and want to take their skills to the next level. CTAL-TAE Exam covers advanced topics related to automation testing, including test automation design, implementation and maintenance, and test automation frameworks.

With the help of our CTAL-TAE practice materials, you can successfully pass the actual exam with might redoubled. Our company owns the most popular reputation in this field by providing not only the best ever CTAL-TAE study guide but also the most efficient customers' servers. We can lead you the best and the fastest way to reach for the certification of CTAL-TAE Exam Dumps and achieve your desired higher salary by getting a more important position in the company.

ISQI ISTQB Certified Tester Advanced Level, Test Automation Engineering Sample Questions (Q18-Q23):

NEW QUESTION # 18

A defect in a SUT has been resolved and validated by an automated defect re-test in the current release of the software. This retest has now been added to the automated regression test suite.

Which statement BEST describes a reason why this defect could re-occur in future releases?

- A. Automated defect confirmation testing is not effective at confirming that the resolved defect will continue to work in future releases
- B. The configuration management process does not properly control the synchronization between software archives
- C. The automated regression test suite is not run consistently for future releases.
- D. The automated regression test suite has a narrower scope of functionality

Answer: C

NEW QUESTION # 19

You are evaluating the best approach to implement automated tests at the UI level for a web app. Specifically, your goal is to allow test analysts to write automated tests in tabular format, within files that encapsulate logical test steps related to how a user interacts with the web UI, along with the corresponding test data. These steps must be expressed using natural language words that represent the actions performed by the user on the web UI. These files will then be interpreted and executed by a test execution tool. Which of the following approaches to test automation is BEST suited to achieve your goal?

- A. Test-driven development
- B. Data-driven testing
- C. Linear scripting
- **D. Keyword-driven testing**

Answer: D

Explanation:

The described goal matches the defining characteristics of keyword-driven testing: tests are expressed using keywords (action words) that represent user operations, often arranged in tabular form with parameters/test data. TAE describes keyword-driven approaches as enabling non-programmers (e.g., test analysts) to create and maintain tests by combining high-level keywords such as "Open Browser," "Click," "Enter Text,"

"Select," "Verify Text," etc., while the underlying automation framework maps those keywords to executable code. The use of files interpreted by a test execution tool is also typical: keyword tables (or similar structured specifications) are read and executed by the automation engine. Data-driven testing focuses on separating test logic from test data, typically running the same script multiple times with different datasets; it does not inherently require natural-language action words or tabular step definitions (though it can be combined).

Linear scripting is code-centric and not aligned with analyst-authored natural language step tables. TDD is unrelated to the requirement of tabular, natural-language keyword specification for UI test steps. Therefore, keyword-driven testing is the best fit for the stated approach.

NEW QUESTION # 20

Which of the following practices can be used to specify the active (i.e., actually available) features for each release of the SUT and determine the corresponding automated tests that must be executed for a given release?

- A. Test-driven development
- **B. The use of feature toggles**
- C. Feature-driven development
- D. The use of feature files

Answer: B

Explanation:

TAE materials commonly describe feature toggles (feature flags) as a mechanism to control which features are active in a given release or deployment without necessarily changing the codebase structure for each variant. Because toggles determine what functionality is actually enabled, they provide a practical basis for selecting which automated tests should run for that release configuration. When a feature is disabled via a toggle, executing tests for it can create false failures or wasted effort; when enabled, the corresponding tests become relevant as release evidence. Feature-driven development is a product/development planning approach and does not, by itself, provide an operational mechanism to declare what is active at runtime.

Feature files (often associated with BDD) specify behavior scenarios, but they do not inherently indicate whether a feature is active in a particular release unless explicitly tied to toggles or release configuration.

TDD focuses on coding practices at the unit level and similarly does not specify release-time feature availability. Feature toggles directly express "active vs. inactive" functionality and can be used to drive risk- based and relevance-based test execution decisions, matching the requirement precisely.

NEW QUESTION # 21

You are using a gTAA to create a TAS for a project. The TAS is aimed specifically at automating a suit of existing manual test cases for standalone desktop applications. All the interfaces between the TAS and SUT will be from the CUI of the application.

Which of the following layers of the gTAA should you focus on for the TAS?

- A. The Test Definition layer
- B. The Test Execution layer
- C. The test Generation layer
- **D. The Test Adaption layer**

Answer: D

NEW QUESTION # 22

Some automated regression test scripts run by a TAS in a given test environment make calls to private APIs that require authentication for all requests (the authentication method is the same for all APIs). The SUT is a business-critical system. The following two changes are planned: a change in the authentication method of all APIs and a minor upgrade of the OS (Operating System) in the test environment. You have updated the test scripts to cope with the change in the API authentication method. Which of the following sequences of activities is BEST to ensure that the test scripts are not adversely affected by these changes?

- **A. Implement one change at a time and run a subset of the updated test scripts after each change, and finally run all the updated test scripts**
- B. First implement the change in the API authentication method, then upgrade the OS, and finally run all the updated test scripts
- C. Implement one change at a time and run a subset of the updated test scripts after each change
- D. First upgrade the OS, then implement the change in the API authentication method, and finally run all the updated test scripts

Answer: A

Explanation:

TAE recommends controlled change management to isolate causes when multiple changes are introduced.

When you apply more than one change at once, diagnosing failures becomes harder because you cannot easily attribute effects to a specific change. The best practice is to implement changes incrementally, validating automation and system behavior after each change using a representative subset of tests (e.g., smoke/build verification or targeted regression) to quickly detect issues. Because the system is business-critical, risk mitigation is stronger: you want early detection and clear attribution. After each change is validated with a subset, you then execute the full updated regression suite to ensure overall coverage and confidence. Options A and C apply two changes before running tests, which reduces diagnostic clarity and increases the risk of late discovery. Option D describes incremental changes with subset testing but omits the final full-suite run, which TAE would recommend to ensure broad coverage after all changes have been applied. Therefore, the best sequence is: change one item, run a subset, repeat for the next change, then run all updated scripts.
