CrowdStrike Certified Cloud Specialist Sample Questions (Q212-Q217):

NEW QUESTION # 212
A security administrator is configuring pre-runtime protection in CrowdStrike Falcon to ensure that only trusted container images from specific registries are scanned and allowed for deployment.
What is the best approach for adding registry connection details?

- A. Set up registry connections using only the default Falcon registry settings without modifications.
- B. Disable scanning for images from private repositories since they are already trusted and internally managed.
- C. Specify the registry URL, enable authentication if required, and configure scanning policies for approved images.
- D. Add all public and private container registries without authentication to ensure maximum compatibility.

Answer: C

Explanation:
Option A: Default Falcon registry settings may not cover all organizational needs. Custom configurations should be made to ensure alignment with security policies.
Option B: Allowing all registries without authentication increases security risks, as unauthorized or malicious images can be pulled and deployed.
Option C: To ensure pre-runtime protection, administrators should define registry connection details, specify the registry URL, enable authentication (if needed), and set image scanning policies for security compliance.
Option D: Private repositories are not automatically secure. Vulnerabilities can still exist in private images, making it critical to enable scanning even for internal sources.

NEW QUESTION # 213
What is the primary benefit of using automated remediation in a cloud security workflow?

- A. Reducing response time by taking immediate action on detected threats
- B. Increasing cloud environment performance by optimizing resource utilization
- C. Ensuring compliance with industry regulations without manual checks
- D. Eliminating the need for human oversight during incident response

Answer: A

Explanation:
Option A: Automated remediation complements, but does not replace, human oversight. Security teams still need to review actions, analyze complex incidents, and refine policies to ensure proper functionality.
Option B: While automated remediation can support compliance by addressing security gaps promptly, it does not fully replace manual checks, audits, or detailed compliance reviews.
Option C: Automated remediation is focused on security incident response, not resource optimization. While securing the environment may have indirect performance benefits, this is not the primary goal.
Option D: The primary advantage of automated remediation is its ability to act quickly and mitigate threats as soon as they are detected, significantly reducing response time. This minimizes the potential impact of threats by containing them before they can escalate or cause further damage.

NEW QUESTION # 214
Which of the following describes the behavior of a runtime protection policy applied to containerized workloads in CrowdStrike Falcon?

- A. Monitors and prevents known malicious activities in real-time within the container environment.
- B. Blocks all system calls from container processes by default.
- C. Works only with specific container orchestration platforms like Kubernetes.
- D. Requires manual signature updates to detect threats in the runtime environment.

Answer: A

Explanation:
Option A: Runtime protection focuses on detecting and mitigating malicious activities, such as privilege escalation attempts or unauthorized network connections, in real-time.
Option B: Blocking all system calls would render containers non-functional. Runtime protection policies are designed to monitor and selectively block only malicious or suspicious activities.
Option C: Runtime protection policies are platform-agnostic and can protect containers regardless of the orchestration platform being used, including Kubernetes, Docker Swarm, or others.
Option D: CrowdStrike Falcon uses a combination of signature-based and behavior-based detection techniques, with automatic updates to threat intelligence, removing the need for manual signature updates.

NEW QUESTION # 215

A financial services company needs to register multiple cloud accounts while adhering to strict compliance regulations such as SOC 2, GDPR, and HIPAA. The company must ensure that the cloud account registration method provides strong access controls, auditability, and compliance tracking.

Which of the following is the best approach?

- A. Use a shared service account with a single set of credentials for registering all cloud accounts.
- B. Use an automated cloud registration workflow integrated with identity and access management (IAM) policies.
- C. Allow developers to register their cloud accounts independently with no oversight to speed up onboarding.
- D. Register each cloud account using an administrator's personal access credentials.

Answer: B

Explanation:

Option A: Allowing developers to register cloud accounts without oversight creates a shadow IT problem, making it difficult to enforce security policies and track compliance. Unauthorized or improperly registered accounts may violate regulatory requirements.

Option B: Using a shared service account violates least privilege principles and creates compliance risks. If the shared credentials are compromised, multiple accounts could be affected, and it becomes difficult to track individual actions for compliance audits.

Option C: Using an administrator's personal credentials introduces security and compliance risks.

If the administrator leaves the company or their credentials are compromised, it could affect multiple cloud accounts, violating least privilege access principles.

Option D: An automated cloud registration workflow with IAM integration ensures security, auditability, and compliance tracking. IAM policies enforce access controls, ensuring that only authorized users and services can register accounts while maintaining compliance with regulations.

NEW QUESTION # 216

When configuring a Falcon Fusion workflow to notify individuals after automated remediation, which action ensures effective communication with the security team?

- A. Set the workflow to terminate immediately after the remediation action is executed.
- B. Rely solely on the Falcon platform's detection history to inform the team.
- C. Use a webhook to trigger an external system without specifying recipients.
- D. Integrate the workflow with an external notification system like Slack or email.

Answer: D

Explanation:

Option A: Integrating with external systems ensures that individuals receive real-time notifications about automated remediation actions. Platforms like Slack or email allow the security team to stay informed promptly and collaborate efficiently on follow-up actions.

Option B: Terminating the workflow immediately after remediation would skip the notification step, preventing the team from being informed. Notifications are critical for tracking and transparency.

Option C: Detection history provides useful insights but does not proactively notify individuals.

Relying solely on it may result in delayed responses or missed alerts.

Option D: While webhooks are useful for integrating with external systems, failing to specify recipients or channels makes the notification less actionable. Clear communication pathways are necessary.
