All knowledge contained in our JN0-481 Practice Engine is correct. Our workers have checked for many times. Also, we will accept annual inspection of our JN0-481 exam simulation from authority. The results show that our JN0-481 study materials completely have no problem. Our company is rated as outstanding enterprise. And at the same time, our website have become a famous brand in the market. We also find that a lot of the fake websites are imitating our website, so you have to be careful.

Prep4SureReview offers a free demo of Juniper JN0-481 exam dumps before the purchase to test the features of the products. Prep4SureReview also offers 12 months of free Juniper JN0-481 Exam Questions updates if the JN0-481 certification exam content changes after purchasing our JN0-481 exam dumps.

JN0-481 Valid Exam Forum | JN0-481 Practice Exam Pdf

The Data Center, Specialist (JNCIS-DC) (JN0-481) is one of the popular exams of JN0-481. It is designed for Juniper aspirants who want to earn the Data Center, Specialist (JNCIS-DC) (JN0-481) certification and validate their skills. The JN0-481 test is not an easy exam to crack. It requires dedication and a lot of hard work. You need to prepare well to clear the JN0-481 test on the first attempt. One of the best ways to prepare successfully for the JN0-481 examination in a short time is using real Juniper JN0-481 Exam Dumps.

Juniper Data Center, Specialist (JNCIS-DC) Sample Questions (Q57-Q62):

NEW QUESTION # 57

You have accessed your deployed blueprint and see the banner shown in the exhibit.

Which two statements are correct in this scenario? (Choose two.)

- A. Devices must be assigned to profiles.
- B. There are changes that are not active on the fabric.
- C. There are anomalies that must be addressed.
- D. Resources must be assigned to devices.

Answer: B,C

Explanation:

In Apstra 5.1, the top-level blueprint banner uses tab indicators (colored badges) to summarize blueprint status across areas such as Staged, Uncommitted, Active, and Analytics. The presence of an Uncommitted indicator signifies that there are staged modifications that have not yet been committed and therefore are not part of the active, deployed intent. That directly corresponds to the statement that changes exist which are not active on the fabric.

At the same time, the banner shows an Active indicator in an alarm state, which reflects that the running fabric has issues requiring attention—commonly surfaced as anomalies (for example, configuration deviation, interface/link faults, protocol/session issues, or service-impacting conditions). In Apstra's operational model, these issues appear as anomalies that operators should investigate and remediate to restore compliance and health. Therefore, the statement that there are anomalies that must be addressed is also correct. The remaining options are not implied by this banner alone. Device profile assignment and resource assignment are build-time tasks, but their absence is not what the Uncommitted/Active alert indicators are specifically communicating here. The banner is highlighting uncommitted intent changes and active anomalies that affect the deployed blueprint state and assurance posture.

NEW QUESTION # 58

What is the purpose of an interface map in Juniper Apstra?

- A. An interface map associates a logical device with a device profile.
- B. An interface map specifies the connections between racks in a template.
- C. An interface map specifies the number of ports and the port speeds of a logical device
- **D. An interface map specifies a connection between the interfaces of two devices.**

Answer: D

Explanation:

According to the Juniper documentation¹, an interface map is a configuration template that maps interfaces between logical devices and physical hardware devices (represented with device profiles) while adhering to vendor specifications. An interface map specifies a connection between the interfaces of two devices, such as a leaf and a spine, a leaf and a server, or a leaf and an external gateway. An interface map can also specify port transformations, such as breaking out a 40 GbE port into four 10 GbE ports, or disabling unused ports. An interface map can be used to achieve the intended network configuration rendering and to enable features such as LAG, ESI-LAG, or MLAG. Therefore, the correct answer is B. An interface map specifies a connection between the interfaces of two devices. Reference: Interface Maps (Datacenter Design)

NEW QUESTION # 59

What are three phases of the Juniper Apstra data center life cycle? (Choose three.)

- **A. design**
- B. configuration
- **C. operational phase**
- D. installation
- **E. deployment**

Answer: A,C,E

Explanation:

Apstra organizes the data center life cycle into distinct phases that align with intent-based networking principles:

- Design: Define the architecture, templates, logical devices, racks, and connectivity.

- Deployment: Instantiate the design into a real fabric, assign systems, push configurations.

- Operational Phase: Monitor, manage, and analyze the running network using telemetry, analytics, and automation tools.

NEW QUESTION # 60

You are working with a three-stage IP fabric using EBGp for peering. In this scenario, which two actions are required to implement ECMP? (Choose two.)

- A. Use the multipath multiple-as BGP parameter.
- B. Use a load balancing policy applied to BGP as an import policy.
- C. Use a load balancing policy applied to BGP as an export policy.
- D. Use a load balancing policy applied to the forwarding table as an export policy.

Answer: A,C

Explanation:

To implement ECMP in IP fabric using EGBP, you need to enable BGP to install multiple equal-cost paths in the routing table and to advertise them to the peers.

NEW QUESTION # 61

In the case of IP Clos data center five-stage fabric design, what are two roles of the super spines? (Choose two.)

- A. Super spines connect to all spine devices within the five-stage architecture.
- B. Super spines are always connected to an external data center gateway.
- C. Super spines are used to interconnect two different data center pods.
- D. Super spines are used to connect leaf nodes within a data center pod.

Answer: A,C

Explanation:

In the case of IP Clos data center five-stage fabric design, the super spines are the devices that provide the highest level of aggregation in the network. They have two main roles:

Super spines are used to interconnect two different data center pods. A pod is a cluster of leaf and spine devices that form a 3-stage Clos topology. A 5-stage Clos topology consists of multiple pods that are connected by the super spines. This allows for scaling the network to support more devices and bandwidth.

Super spines connect to all spine devices within the five-stage architecture. The spine devices are the devices that provide the second level of aggregation in the network. They connect to the leaf devices, which are the devices that provide access to the end hosts. The super spines connect to all the spine devices in the network, regardless of which pod they belong to. This provides any-to-any connectivity between the pods and enables optimal routing and load balancing.

NEW QUESTION # 62

.....

The study materials from our company can help you get your certification easily, we believe that you have been unable to hold yourself back to understand our Data Center, Specialist (JNCIS-DC) guide torrent, if you use our study materials, it will be very easy for you to save a lot of time. In order to meet the needs of all customers, Our JN0-481 study torrent has a long-distance aid function. If you feel confused about our JN0-481 test torrent when you use our products, do not hesitate and send a remote assistance invitation to us for help, we are willing to provide remote assistance for you in the shortest time.
