Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q81-Q86):

NEW QUESTION # 81

A media company needs to migrate its Windows-based video editing environment to AWS. The company's current environment

processes 4K video files that require sustained throughput of 2 GB per second across multiple concurrent users. The company's storage needs increase by 1 TB each week. The company needs a shared file system that supports SMB protocol and can scale automatically based on storage demands. Which solution will meet these requirements?

- A. Deploy Amazon S3 File Gateway by using multiple cached gateway instances. Configure S3 Transfer Acceleration.
- B. Deploy an Amazon FSx for Lustre file system with a Persistent 2 deployment type. Provision the file system with 2 TB of storage.
- **C. Deploy an Amazon FSx for Windows File Server Multi-AZ file system with SSD storage.**
- D. Deploy an Amazon Elastic File System (Amazon EFS) file system in Max I/O mode. Provision mount targets in multiple Availability Zones.

Answer: C

Explanation:

* The workload is Windows-based and requires a shared file system with SMB support and very high throughput for 4K video editing.

* Amazon FSx for Windows File Server is a fully managed, highly available native Windows file system that supports the SMB protocol, Active Directory integration, and can deliver high throughput and low latency suitable for media workloads.

* FSx for Windows File Server supports automatic storage scaling to grow file system capacity as data increases, matching the requirement of +1 TB per week with minimal admin effort.

* A Multi-AZ SSD deployment provides high availability and performance.

Why others are not correct:

* B: Amazon EFS is NFS, not SMB, and is optimized for Linux clients, not Windows-based environments.

* C: FSx for Lustre is a high-performance POSIX file system typically used with Linux-based HPC workloads, not Windows + SMB.

* D: S3 File Gateway is not designed for sustained multi-GB/s shared-edit performance and adds additional complexity; it is more suited for backup/archival and limited shared file access.

NEW QUESTION # 82

A company is planning a large event where a promotional offer will be introduced. The company's website is hosted on AWS and backed by an Amazon RDS for PostgreSQL DB instance. The website explains the promotion and includes a sign-up page that collects user information and preferences. Management expects large and unpredictable volumes of traffic periodically, which will create many database writes. A solutions architect needs to build a solution that does not change the underlying data model and ensures that submissions are not dropped before they are committed to the database.

Which solution meets these requirements?

- **A. Use Amazon ElastiCache for Memcached to increase write capacity to the DB instance.**
- B. Use Amazon SQS to decouple the application and database layers. Configure an AWS Lambda function to write items from the queue into the database.
- C. Immediately before the event, scale up the existing DB instance to meet the anticipated demand. Then scale down after the event.
- D. Migrate to Amazon DynamoDB and manage throughput capacity with automatic scaling.

NEW QUESTION # 83

A company operates a website on Amazon EC2 Linux instances. Some of the instances are faring Troubleshooting points to insufficient swap space on the failed instances. The operations team lead needs a solution to monitor this.

What should a solutions architect recommend?

- A. Install an Amazon CloudWatch agent on the instances. Run an appropriate script on a set schedule. Monitor SwapUtilization metrics in CloudWatch.
- B. Enable detailed monitoring in the EC2 console. Create an Amazon CloudWatch SwapUtilization custom metric. Monitor SwapUtilization metrics in CloudWatch.
- **C. Use EC2 metadata to collect information, then publish it to Amazon CloudWatch custom metrics. Monitor SwapUsage**

metrics in CloudWatch.

- D. Configure an Amazon CloudWatch SwapUsage metric dimension. Monitor the SwapUsage dimension in the EC2 metrics in CloudWatch.

Answer: C

NEW QUESTION # 84

Which IAM role do you use to grant AWS Lambda permission to access a DynamoDB Stream?

- A. Invocation role
- B. Event Source role
- C. Dynamic role
- D. Execution role

Answer: D

Explanation:

You grant AWS Lambda permission to access a DynamoDB Stream using an IAM role known as the "execution role".
