UiPath Certified Professional Agentic Automation Associate (UiAAA) Sample Questions (Q39-Q44):

NEW QUESTION # 39

When configuring escalations for an agent, what is a key step to ensure the agent knows when to use the escalation during execution?

- A. Directly assign an escalation recipient to ensure proper routing, which eliminates the need for agent- specific prompts in the escalation logic.
- B. Configure escalation behavior entirely within the outcome behavior section, specifying how each resolution should be handled.
- C. Utilize required fields in the inputs section of the escalation to define conditions for triggering escalations dynamically.
- D. Add a prompt in the properties panel to help the agent determine the appropriate circumstances for using the escalation.

Answer: D

Explanation:

Dis correct - in UiPath agent design, when adding an escalation, a key step is to provide a clear and contextual prompt in the Properties panel that tells the agent when and why to trigger that escalation.

This prompt:

- * Informs the LLM of the business logic behind escalation
- * Sets the thresholds or exception cases that warrant human review
- * Ensures escalation is used intelligently and selectively

For example:

"If the customer expresses dissatisfaction and refund amount exceeds \$500, escalate to supervisor." This guidance is crucial because agents rely on prompts to decide, not just flow logic. Without a well-written prompt, the LLM may over-escalate or miss critical cases.

Option A is partially correct, but outcome behavior configures what happens after escalation- not when to trigger it.

B skips the logic layer entirely.

C refers to field requirements but doesn't influence agent decision-making logic.

The prompt within the escalation tool is where the LLM's judgment gets guided, making D the essential step for enabling smart, situational escalations.

NEW QUESTION # 40

How does agentic orchestration ensure consistency and reliability in processes?

- A. By significantly reducing the level of human intervention required, confining their involvement to only a minimal fraction of the overall operational processes and decision-making activities.
- **B. By using standard business process modeling notation (BPMN) to define business rules and guardrails for AI agents.**
- C. By forcing robots and people to work separately, maintaining a strict division of roles without overlap.
- D. By allowing agents complete autonomy to make independent decisions based on real-time scenarios.

Answer: B

Explanation:

The correct answer is A- UiPath's agentic orchestration layer uses BPMN (Business Process Model and Notation) to visually model and govern the workflows in which AI agents operate. This is a core feature of UiPath Maestro, where BPMN ensures:

- * Clear definition of rules, handoffs, and agent actions
- * Guardrails for decision-making
- * Coordination between people, robots, and AI agents
- * Reusability and governance of business logic

Agentic orchestration does not mean giving full autonomy to agents (as in D), nor does it aim to eliminate human input entirely (as in B). Instead, it promotes adaptive workflows where human review, agent action, and automation co-exist in a governed way.

Option C is incorrect because UiPath specifically encourages hybrid collaboration between humans, bots, and agents. BPMN is the bridge that brings that orchestration to life.

NEW QUESTION # 41

You are building an agent that classifies incoming emails into one of three categories: Urgent, Normal, or Spam. You want to improve accuracy by using few-shot examples in a structured format. Which approach best supports this goal?

- A. Use unlabeled prompts followed by ranked categories:
Classify this. "Need update on report." - [1] Urgent [2] Normal [3] Spam
- B. Show one example and leave the label blank for inference.
- **C. Use examples such as:
Input: "Please address this issue immediately, server is down!" Output: "Urgent"**
- D. Include three random emails and let the LLM guess the intent.

Answer: C

Explanation:

Comprehensive and Detailed Explanation (from UiPath Agentic Automation documentation):

The correct approach is C, as it best reflects the few-shot prompting pattern, which is a well-documented and recommended technique in both UiPath Autopilot™ and broader agentic AI design for improving intent classification accuracy.

In UiPath Agentic Automation, especially in Prompt Engineering, few-shot examples serve to "ground" the Large Language Model (LLM) with task-specific context. Providing structured input-output pairs (as shown in option C) allows the model to learn from the context and mirror the expected output more reliably - enhancing classification precision.

For instance, UiPath recommends using clearly formatted training examples in this structure:

Input: "[Text]"

Output: "[Label]"

This aligns with UiPath's guidance under the Prompt Engineering Framework, which highlights that using few-shot exemplars with clear task demonstrations significantly improves model performance over zero-shot or ambiguous input formats (as in options A or B). Option D also underperforms due to insufficient grounding.

UiPath emphasizes the importance of label clarity, format consistency, and explicit instruction- all of which are satisfied in Option C. This method also supports prompt generalization for new inputs by modeling how categorization should happen, not just what categories exist.

This technique is crucial in real-world agentic workflows where LLMs handle noisy, unstructured data (like emails), and are expected to trigger appropriate downstream actions such as ticket creation, escalation, or filtering.

NEW QUESTION # 42

Which of the following is a benefit of UiPath-built agents?

- A. They require extensive coding expertise for development.
- B. They cannot integrate with UiPath Orchestrator.
- C. They allow for quick agent creation using a low-code development application.
- D. They are limited to handling structured workflows only.

Answer: C

Explanation:

D is correct - a major advantage of UiPath-built agents is their low-code creation model, which allows business users and developers to quickly create, test, and deploy agents.

Key points from UiPath's Agentic Automation platform:

Agents are built in Studio Web, using a drag-and-drop UI and agent designer canvas.

Low-code tools allow teams to design agent prompts, behavior logic, tool connections, and escalations without deep programming skills.

Agents integrate with UiPath Orchestrator for full lifecycle management.

UiPath's low-code stack is designed to:

Lower the barrier to AI adoption

Accelerate time-to-value

Allow cross-functional teams to collaborate on intelligent automation

Options A and B are incorrect - agents support both structured and unstructured workflows, and fully integrate with Orchestrator.

C is false - low-code is a core value prop.

NEW QUESTION # 43

What is the significance of the "as-is" process map in identifying agentic automation opportunities?

- A. It defines the current way tasks are performed, helping to highlight inefficiencies, bottlenecks, and areas for improvement that can uncover automation potential.
- B. It serves as a finalized map of processes ready for automation, removing the need for further adjustments or workshops.
- C. It establishes the goals of the new process, serving as a foundation to later create the "to-be" process map.
- D. It directly outlines the roles that agents will assume in the optimized process, ensuring alignment with automation requirements.

Answer: A

Explanation:

The correct answer is A- the "as-is" process map is a foundational tool in UiPath's Agentic Blueprint Design framework. It visualizes the current state of how work is performed, enabling teams to:

* Identify manual, repetitive, or time-consuming tasks

* Spot delays, rework loops, or human bottlenecks

* Discover areas where agents can augment or replace tasks

It acts as a baseline diagnostic, not an implementation-ready flow.

This is a key step in workshops led by process owners or business SMEs, before designing the "to-be" process where agents are introduced.

B is incorrect - the as-is map is not final.

C refers to the optimized state, not the current one.

D confuses the mapping's role - it captures the present, not the goals.
