NEW QUESTION # 712

What data is stored in the Snowflake storage layer? (Select TWO).

- A. Standard and secure view results
- B. Query history
- C. Micro-partitions
- D. Persisted query results
- E. Snowflake parameters

Answer: C,D

Explanation:

The Snowflake storage layer is responsible for storing data in an optimized, compressed, columnar format. This includes micro-partitions, which are the fundamental storage units that contain the actual data stored in Snowflake. Additionally, persisted query results, which are the results of queries that have been materialized and stored for future use, are also kept within this layer. This design allows for efficient data retrieval and management within the Snowflake architecture.

- A. Use a custom-built connector.
- B. Use Snowflake's native API.
- C. Connect through Snowflake's JDBC or ODBC drivers
- D. Contact Snowflake Support for a new driver.

- A. Insert a double colon (: :) between the VARIANT column name and any first-level element.
- B. Insert a colon (:) between the VARIANT column name and any first-level element.
- C. Insert a colon (:) between the VARIANT column name and any second-level element.
- D. Insert a double colon (: :) between the VARIANT column name and any second-level element.

Answer: B

To traverse semi-structured data in Snowflake, a user can insert a colon (:) between the VARIANT column name and any first-level element. This path syntax is used to retrieve elements in a VARIANT column.

NEW QUESTION # 715

If queries start to queue in a multi-cluster virtual warehouse, an additional compute cluster starts immediately under what setting?

- A. Economy scaling policy
- **B. Auto-scale mode**
- C. Maximized mode
- D. Standard scaling policy

Answer: B

Explanation:

In Snowflake, when queries begin to queue in a multi-cluster virtual warehouse, an additional compute cluster starts immediately if the warehouse is set to auto-scale mode. This mode allows Snowflake to automatically add or resume additional clusters as soon as the workload increases, and similarly, shut down or pause the additional clusters when the load decreases

NEW QUESTION # 716

Which query profile statistics help determine if efficient pruning is occurring? (Choose two.)

- **A. Partitions total**
- B. Bytes spilled to local storage
- C. Percentage scanned from cache
- D. Bytes sent over network
- **E. Partitions scanned**

Answer: A,E

Explanation:

Efficient pruning in Snowflake is indicated by the number of partitions scanned out of the total available. If a small percentage of partitions are scanned, it suggests that the pruning process is effectively narrowing down the data, which can lead to improved query performance
