| 주제 1 | <ul style="list-style-type: none"> <li>• Campus Fabric Architecture: This section of the exam measures the skills of Network Design Engineers and focuses on understanding and deploying Campus Fabric Architectures. It introduces essential design concepts such as EVPN multihoming, IP Clos architecture, and micro-segmentation. The section also compares CRB and ERB models, explains scaling requirements, and highlights how the Campus Fabric Core-Distribution design supports high-performance, scalable, and secure enterprise networks.</li> </ul> |

|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 주제 2 | <ul style="list-style-type: none"> <li>• <b>Wired Assurance Fundamentals:</b> This section of the exam measures the skills of Network Support Engineers and covers the foundational elements of Wired Assurance within the MistAI ecosystem. It introduces candidates to key concepts such as supported devices, solution architecture, and the main features and components that define Wired Assurance functionality. Additionally, it highlights how MistAI accounts, analytics, and subscriptions integrate to deliver intelligent insights for network performance and operations.</li> </ul>                                                       |
| 주제 3 | <ul style="list-style-type: none"> <li>• <b>Wired Assurance Management or Operations:</b> This section of the exam measures the skills of Network Operations Engineers and focuses on the management and operational aspects of Wired Assurance. It covers switch management, port profiles, and dynamic port configuration to ensure optimal network performance. The section also explores service-level expectations, client insights, and the use of APIs for improved monitoring and automation. Candidates gain an understanding of how MistAI enables proactive management and predictive troubleshooting to maintain service quality.</li> </ul> |
| 주제 4 | <ul style="list-style-type: none"> <li>• <b>Wired Assurance Provisioning or Deployment:</b> This section of the exam measures the skills of Network Deployment Specialists and focuses on the provisioning and deployment processes of Wired Assurance. It includes the essential steps and options involved in setting up networks, from configuration templates to deployment methodologies. Candidates learn about provisioning procedures, supported architectures, and the use of site variables to streamline automation and consistency across wired infrastructures.</li> </ul>                                                                  |
| 주제 5 | <ul style="list-style-type: none"> <li>• <b>Campus EVPN-VXLAN:</b> This section of the exam measures the skills of Data Center Network Engineers and explores the key principles of VXLAN and EVPN technologies. Candidates learn about Layer 2 tunneling, data and control plane operations, and the functions of VTEPs and VXLAN gateways. Additionally, it covers advanced EVPN concepts such as multipath routing, route types, and identifiers. The section concludes with a focus on MAC learning and policy applications to ensure efficient, scalable, and resilient network fabrics.</li> </ul>                                                 |

## Juniper JN0-460최신버전 시험자료 & JN0-460시험대비 최신버전 자료

KoreaDumps사이트에서 제공하는 Juniper 인증 JN0-460 덤프의 일부 문제와 답을 체험해보세요. 우리 KoreaDumps의 Juniper 인증 JN0-460 덤프 공부자료를 선택해주신다면 우리는 최선을 다하여 여러분이 꼭 한번에 시험을 패스할 수 있도록 도와드리겠습니다. 만약 여러분이 우리의 인증 시험 덤프를 보시고 시험이랑 틀려서 패스를 하지 못하였다면 우리는 무조건 덤프비용 전부를 환불해드릴것입니다. KoreaDumps제품으로 자격증을 정복합시다!

## 최신 JNCIS-MistAI-Wired JN0-460 무료샘플문제 (Q65-Q70):

### 질문 # 65

From left to right, what is the correct hierarchical order of switch configuration priorities from least to most preferred?

- A. Org-level template, Site Configuration, Switch Settings
- B. Site Configuration, Switch Settings, Org-level template
- C. Switch Setting, Site Configuration, Org-level template
- D. Site Configuration, Org-level template, Switch Settings

정답: A

### 질문 # 66

A customer has purchased five new switches and assigned them to a site.

In the configuration hierarchy, how should a user configure the name or role of each switch?

- A. Configure additional CLI commands on each switch.
- B. Configure each switch individually on the Switch Configuration menu under the Switches menu.
- C. Add names and roles of each switch to the organization-level templates.
- D. Configure names and roles on the site-specific configuration.

**정답: B**

**설명:**

In Juniper Mist Cloud, configuration hierarchy includes organization-level templates, site-level configurations, and individual switch configuration. Site and organization levels provide shared settings, while per-device details such as hostname or role are set individually.

"Device-specific attributes such as hostname, role, or management IP are configured under the individual switch configuration menu. Templates and site configurations apply globally, while individual configurations override device-level parameters." Option

A: Incorrect - site configuration applies to all switches at a site, not unique details.

Option B: Incorrect - CLI configuration is not used when switches are managed by Mist Cloud.

Option C: Correct - each switch's name and role are configured individually under Switches # Switch Configuration.

Option D: Incorrect - organization templates define global settings, not per-switch names.

### 질문 # 67

You are experiencing issues with your video streams. In this scenario, which SLE and classifier should you inspect to see if BUM traffic is a problem?

- A. Successful Connect --> Authentication
- **B. Throughput Storm Control**
- C. Throughput Congestion
- D. Throughput -> Interface Anomalies

**정답: B**

**설명:**

According to Juniper Mist documentation, the Throughput Service Level Expectation (SLE) is the primary metric used to measure the ability of wired clients to pass traffic across the physical network without impedance. This SLE is critical for diagnosing issues with real-time, high-bandwidth applications such as video streams, which are highly sensitive to packet loss and latency. Within the Throughput SLE, the Storm Control classifier is specifically designed to identify "bad user minutes" caused by the suppression of Broadcast, Unknown Unicast, and Multicast (BUM) traffic.

Storm control is a mechanism that enables the switch to monitor traffic levels and drop BUM packets when a specified traffic level-known as the storm control level-is exceeded. This prevents a "traffic storm" from proliferating and degrading the overall performance of the LAN. While this is a vital security feature to prevent network meltdowns, it can inadvertently impact legitimate traffic. For instance, if multicast-based video streams or other heavy BUM traffic exceed the configured bandwidth percentage on a port, the switch will drop those packets to protect the rest of the network.

When troubleshooting video stream issues, network administrators should inspect the Storm Control classifier to see if it is triggering "bad user minutes". If the Mist dashboard indicates failures under this classifier, it signifies that the switch hardware is actively dropping packets because the BUM traffic limit has been reached. This provides immediate root-cause evidence, allowing the administrator to determine if they need to adjust the storm control thresholds within the Port Profile or investigate the source of the excessive broadcast traffic. By correlating these hardware-level events with the end-user experience, Mist AI simplifies the resolution of complex performance problems that traditional "up/down" monitoring would miss.

### 질문 # 68

You are asked to configure switch ports to VLANs depending on which type of device is connected to it. Which Mist feature will accomplish this task?

- A. select switch configuration
- B. bulk upload of switch configuration
- C. site variables
- **D. dynamic port configuration**

**정답: D**

**설명:**

According to Juniper Mist documentation, Dynamic Port Configuration (DPC)-also referred to as Dynamic Port Profiles-is the feature specifically designed to automate the assignment of VLANs and port settings based on the type of device connected to a

switch. This technology enables the concept of "colorless ports," where any device (such as a Juniper Mist Access Point, an IP camera, or a VoIP phone) can be plugged into any available switch port without prior manual configuration. The system functions by using "port assignment rules" that leverage various device properties to identify the connected hardware. These properties include LLDP attributes (System Name, Chassis ID, or Description), MAC addresses (including specific OUI ranges), and RADIUS attributes. For example, a rule can be configured to detect an LLDP System Description starting with "Mist Systems" and automatically apply a

"Wireless AP" port profile. This profile typically includes the management VLAN, PoE settings, and Spanning Tree Protocol (STP) parameters required for an access point to function.

The primary benefit of DPC is the reduction of manual labor and the elimination of configuration errors in large-scale deployments. In traditional environments, an administrator would have to manually assign a VLAN to a specific physical port; with DPC, the Juniper Mist cloud detects the device and pushes the relevant configuration to the switch in real-time. If the device is disconnected, the port can be configured to revert to a "restricted" or "guest" VLAN, ensuring that the network remains secure against unauthorized access. This AI-driven approach drives consistency across multiple sites while significantly streamlining the onboarding of new hardware.

#### 질문 # 69

In a Campus EVPN-VXLAN deployment, VTEP functions include: (Select two)

- A. Direct physical connection to end-user devices
- B. Decapsulating VXLAN packets back into Ethernet frames
- C. Encapsulating Ethernet frames into VXLAN packets
- D. Encrypting all network communications

정답: B,C

#### 질문 # 70

.....

Juniper JN0-460 덤프가 고객님의 기대를 가득 채워드릴수 있도록 정말로 노력하고 있는 KoreaDumps입니다. Juniper JN0-460 덤프는 pdf버전과 소프트웨어버전으로만 되어있었는데 최근에는 휴대폰에서가 사용가능한 온라인버전 까지 개발하였습니다. 날따라 새로운 시스템을 많이 개발하여 고객님의게 더욱 편하게 다가갈수 있는 KoreaDumps가 되겠습니다.
