

ARA-C01 Latest Exam Discount | ARA-C01 Exam Quiz

What's more, part of that Prep4cram ARA-C01 dumps now are free: <https://drive.google.com/open?id=1bQh2faZ6N9CW4pCMwNbIZ6egcRwBkdbK>

With the development of information and communications technology, we are now living in a globalized world. ARA-C01 information technology learning is correspondingly popular all over the world. Modern technology has changed the way how we live and work. When it comes to the study materials selling in the market, qualities are patchy. But our ARA-C01 test material has been recognized by multitude of customers, which possess of the top-class quality, can help you pass exam successfully. On the other hand, our ARA-C01 Latest Dumps are designed by the most experienced experts, thus it can not only teach you knowledge, but also show you the method of learning in the most brief and efficient ways.

One of the great features of our ARA-C01 training material is our ARA-C01 pdf questions. SnowPro Advanced Architect Certification exam questions allow you to prepare for the real ARA-C01 exam and will help you with the self-assessment. You can easily pass the ARA-C01 exam by using ARA-C01 dumps pdf. Moreover, you will get all the updated ARA-C01 Questions with verified answers. If you want to prepare yourself for the real SnowPro Advanced Architect Certification exam, then it is one of the most important ways to improve your ARA-C01 preparation level. We provide 100% money back guarantee on all ARA-C01 braindumps products.

Pass Guaranteed Quiz Snowflake - ARA-C01 - SnowPro Advanced Architect Certification –Reliable Latest Exam Discount

Many students did not perform well before they use SnowPro Advanced Architect Certification actual test. They did not like to study, and they disliked the feeling of being watched by the teacher. They even felt a headache when they read a book. There are also some students who studied hard, but their performance was always poor. Basically, these students have problems in their learning methods. ARA-C01 prep torrent provides students with a new set of learning modes which free them from the rigid learning methods.

Snowflake SnowPro Advanced Architect Certification Sample Questions (Q83-Q88):

NEW QUESTION # 83

Consider the following COPY command which is loading data with CSV format into a Snowflake table from an internal stage through a data transformation query.

This command results in the following error:

```
SQL compilation error: invalid parameter 'validation_mode'
```

Assuming the syntax is correct, what is the cause of this error?

- A. The VALIDATION_MODE parameter does not support COPY statements with CSV file formats.
- B. The value return_all_errors of the option VALIDATION_MODE is causing a compilation error.
- C. The VALIDATION_MODE parameter supports COPY statements that load data from external stages only.

- **D. The VALIDATION_MODE parameter does not support COPY statements that transform data during a load.**

Answer: D

Explanation:

The VALIDATION_MODE parameter is used to specify the behavior of the COPY statement when loading data into a table. It is used to specify whether the COPY statement should return an error if any of the rows in the file are invalid or if it should continue loading the valid rows. The VALIDATION_MODE parameter is only supported for COPY statements that load data from external stages¹.

The query in the question uses a data transformation query to load data from an internal stage. A data transformation query is a query that transforms the data during the load process, such as parsing JSON or XML data, applying functions, or joining with other tables².

According to the documentation, VALIDATION_MODE does not support COPY statements that transform data during a load. If the parameter is specified, the COPY statement returns an error¹. Therefore, option C is the correct answer.

NEW QUESTION # 84

A new user user_01 is created within Snowflake. The following two commands are executed:

Command 1-> show grants to user user_01;

Command 2 ~-> show grants on user user 01;

What inferences can be made about these commands?

- A. Command 1 defines which user owns user_01
Command 2 defines all the grants which have been given to user_01
- **B. Command 1 defines all the grants which are given to user_01 Command 2 defines which role owns user 01**
- C. Command 1 defines which role owns user_01
Command 2 defines all the grants which have been given to user_01
- D. Command 1 defines all the grants which are given to user_01 Command 2 defines which user owns user_01

Answer: B

Explanation:

The SHOW GRANTS command in Snowflake can be used to list all the access control privileges that have been explicitly granted to roles, users, and shares. The syntax and the output of the command vary depending on the object type and the grantee type specified in the command¹. In this question, the two commands have the following meanings:

* Command 1: show grants to user user_01; This command lists all the roles granted to the user user_01.

The output includes the role name, the grantee name, and the granted by role name for each grant. This command is equivalent to show grants to user current_user if user_01 is the current user¹.

* Command 2: show grants on user user_01; This command lists all the privileges that have been granted on the user object user_01. The output includes the privilege name, the grantee name, and the granted by role name for each grant. This command shows which role owns the user object user_01, as the owner role has the privilege to modify or drop the user object².

Therefore, the correct inference is that command 1 defines all the grants which are given to user_01, and command 2 defines which role owns user_01.

NEW QUESTION # 85

How can the Snowpipe REST API be used to keep a log of data load history?

- **A. Call loadHistoryScan every 10 minutes for a 15-minutes range.**
- B. Call loadHistoryScan every minute for the maximum time range.
- C. Call insertReport every 20 minutes, fetching the last 10,000 entries.
- D. Call insertReport every 8 minutes for a 10-minute time range.

Answer: A

Explanation:

The Snowpipe REST API provides two endpoints for retrieving the data load history: insertReport and loadHistoryScan. The insertReport endpoint returns the status of the files that were submitted to the insertFiles endpoint, while the loadHistoryScan

endpoint returns the history of the files that were actually loaded into the table by Snowpipe. To keep a log of data load history, it is recommended to use the loadHistoryScan endpoint, which provides more accurate and complete information about the data ingestion process. The loadHistoryScan endpoint accepts a start time and an end time as parameters, and returns the files that were loaded within that time range. The maximum time range that can be specified is 15 minutes, and the maximum number of files that can be returned is 10,000. Therefore, to keep a log of data load history, the best option is to call the loadHistoryScan endpoint every 10 minutes for a 15-minute time range, and store the results in a log file or a table. This way, the log will capture all the files that were loaded by Snowpipe, and avoid any gaps or overlaps in the time range. The other options are incorrect because:

* Calling insertReport every 20 minutes, fetching the last 10,000 entries, will not provide a complete log of data load history, as some files may be missed or duplicated due to the asynchronous nature of Snowpipe. Moreover, insertReport only returns the status of the files that were submitted, not the files that were loaded.

* Calling loadHistoryScan every minute for the maximum time range will result in too many API calls and unnecessary overhead, as the same files will be returned multiple times. Moreover, the maximum time range is 15 minutes, not 1 minute.

* Calling insertReport every 8 minutes for a 10-minute time range will suffer from the same problems as option A, and also create gaps or overlaps in the time range.

Snowpipe REST API

Option 1: Loading Data Using the Snowpipe REST API

PIPE_USAGE_HISTORY

NEW QUESTION # 86

A company is following the Data Mesh principles, including domain separation, and chose one Snowflake account for its data platform.

An Architect created two data domains to produce two data products. The Architect needs a third data domain that will use both of the data products to create an aggregate data product. The read access to the data products will be granted through a separate role. Based on the Data Mesh principles, how should the third domain be configured to create the aggregate product if it has been granted the two read roles?

- A. Create a hierarchy between the two read roles.
- B. Request a technical ETL user with the sysadmin role.
- C. Use secondary roles for all users.
- **D. Request that the two data domains share data using the Data Exchange.**

Answer: D

Explanation:

In the scenario described, where a third data domain needs access to two existing data products in a Snowflake account structured according to Data Mesh principles, the best approach is to utilize Snowflake's Data Exchange functionality. Option D is correct as it facilitates the sharing and governance of data across different domains efficiently and securely. Data Exchange allows domains to publish and subscribe to live data products, enabling real-time data collaboration and access management in a governed manner. This approach is in line with Data Mesh principles, which advocate for decentralized data ownership and architecture, enhancing agility and scalability across the organization.

NEW QUESTION # 87

Which statement is true about clustering key?

- A. Clustering key can be many per table but each key can have only one column
- B. Clustering key can be many per table and each key can have more than one column
- **C. Clustering key can be one per table but the key can have more than one column**

Answer: C

NEW QUESTION # 88
