## Linux Foundation Certified GitOps Associate Sample Questions (Q21-Q26):

### NEW QUESTION # 21

How do you ensure that you are achieving thePulled AutomaticallyGitOps principle?

- A. By manually triggering deployments and configurations using scripts and commands.
- **B. By having an operator continuously monitor and pull changes from the source of truth.**
- C. By maintaining multiple Git repositories for different aspects of your infrastructure and applications.
- D. By deploying changes from the version control repository by applying them through an automated pipeline when major updates are needed.

**Answer: B**

Explanation:

ThePulled Automaticallyprinciple in GitOps means that agents inside the runtime environment (e.g., controllers/operators)

continuously monitor Git (the source of truth) and automatically pull changes when updates are detected.

"Software agents continuously pull changes from the version control system and reconcile them automatically. This pull-based approach ensures automation, security, and self-healing." Thus, the correct answer is B.

References: GitOps Principles (CNCF GitOps Working Group), Principle 4: Continuously reconciled and pulled automatically.

### NEW QUESTION # 22

In a GitOps framework, what distinct advantage does Configuration as Code (CaC) provide in comparison to traditional infrastructure management approaches?

- A. CaC is less secure and more complex than traditional infrastructure management.
- B. CaC in GitOps exclusively automates the documentation process, whereas traditional approaches focus on manual documentation.
- C. GitOps leverages CaC for immutable infrastructure deployments, ensuring consistent environments, unlike traditional methods that allow ad-hoc changes.
- D. In GitOps, CaC enables dynamic resource allocation during runtime, contrasting with the static configurations in traditional methods.

**Answer: C**

Explanation:

Configuration as Code (CaC) in GitOps ensures that infrastructure and application definitions are stored in Git, version-controlled, and immutable. Unlike traditional approaches (manual changes, scripts, mutable infrastructure), GitOps uses CaC for immutable infrastructure deployments, guaranteeing reproducibility and environment consistency.

"Configuration as Code ensures that system configuration is stored declaratively in version control. This allows immutable deployments, reproducibility, consistency across environments, and prevents ad-hoc manual changes." Thus, the distinct advantage is immutable deployments and consistent environments, making B correct.

### NEW QUESTION # 23

You are working on a GitOps project and have made some changes to the cluster using kubectl. What is the recommended approach to ensure that your changes are continuously reconciled?

- A. Save those changes to the Desired State store and allow the GitOps controller to attempt reconciliation.
- B. Use kubectl to delete all resources that were changed in the cluster and wait for a reconcile.
- C. Reconcile the changes by running a script or command that synchronizes the cluster with the desired state.
- D. Delete and recreate the cluster from scratch to ensure a clean and controlled state.

**Answer: A**

Explanation:

In GitOps, Git is the single source of truth. If changes are made manually in the cluster (via kubectl), those changes will drift from the desired state in Git. To ensure consistency, the correct approach is to update the Git repository (Desired State store) so that the reconciler can continuously apply and maintain those changes.

"The desired state must always be declared in Git. Manual changes in the cluster will be overwritten by reconciliation unless they are committed to the Git repository." Thus, the correct answer is B.

References: GitOps Principles (CNCF GitOps Working Group), Drift and Reconciliation Practices.

### NEW QUESTION # 24

In the context of GitOps, what is one example of how DevSecOps principles manifested, enhancing the traditional DevOps lifecycle?

- A. GitOps uses DevSecOps to enforce manual security checks at each deployment stage.
- B. GitOps enhances the DevSecOps experience by detecting security policy drift.
- C. DevSecOps in GitOps focuses primarily on post-deployment security audits.
- D. In GitOps, DevSecOps leads to the segregation of security tasks, assigning them exclusively to security teams.

**Answer: B**

Explanation:

In GitOps, DevSecOps integrates security into the GitOps workflow by treating security policies as code and storing them in Git. This enables automatic detection of security policy drift and ensures that any misconfiguration or violation is reconciled, just like application and infrastructure code.

"GitOps applies DevSecOps by managing security policies as code. This enables detection of drift in security configurations, ensuring environments remain compliant and secure." Thus, the correct answer is A.

References: GitOps Related Practices (CNCF GitOps Working Group), DevSecOps integration.

### NEW QUESTION # 25

Which GitOps tool has the option for a push-based reconciliation model?

- A. Flagger
- B. Argo Workflows
- C. ArgoCD
- D. Flux

**Answer: C**

Explanation:

Most GitOps tools (e.g., Flux) are pull-based only. However, ArgoCD supports both pull-based reconciliation (via continuous monitoring) and an optional push-based model, where changes can be triggered via webhooks or CI pipelines.

"ArgoCD supports both pull-based reconciliation, where the controller watches the repository, and an optional push-based reconciliation mode triggered by webhooks." Thus, the correct answer is A: ArgoCD.
