## ECCouncil EC-Council Certified DevSecOps Engineer (ECDE) Sample Questions (Q81-Q86):

### NEW QUESTION # 81

(Cheryl Hines has been working as a senior DevSecOps engineer over the past 5 years in an IT company. Due to the robust features offered by Keywhiz secret management tool such as compatibility with all software, untraceable secrets, no impact of power cut or server outage, etc., Cheryl's organization is using it for managing and distributing secrets. To add a secret using Keywhiz CLI, which of the following commands should Cheryl use?)

- A. `$ keywhiz.cli --devTrustStore --admin keywhizAdmin login`  
`$ keywhiz.cli add secret --name mySecretName < mySecretFile.`
- B. `$ keywhiz.cli --devsecTrustStore --admin keywhizAdmin login`  
`$ keywhiz.cli add secret --name mySecretName < mySecretFile.`
- C. `$ keywhiz.cli --devTrustStore --user keywhizAdmin login`  
`$ keywhiz.cli add secret --name mySecretName < mySecretFile.`
- D. `$ keywhiz.cli --DevSecTrustStore --user keywhizAdmin login`  
`$ keywhiz.cli add secret --name mySecretName < mySecretFile.`

**Answer: A**

Explanation:

Keywhiz CLI requires authentication before secrets can be added. The correct process involves logging in using the `--devTrustStore` option and authenticating as an administrator using the `--admin` flag. Once authenticated, the `add secret` command is used with input redirection to securely store the secret. Options that use incorrect flag names, incorrect casing, or invalid trust store identifiers do not follow Keywhiz CLI syntax.

Adding secrets through Keywhiz instead of embedding them in code supports secure secret distribution and management, which is a fundamental aspect of DevSecOps culture. This approach ensures secrets remain protected, auditable, and available even during outages.

### NEW QUESTION # 82

(Brett Ryan has been working as a senior DevSecOps engineer in a multinational company that develops web applications. The team leader of the software development team requested Brett to detect insecure JavaScript libraries in the web application code. Brett would like to perform the vulnerability scanning on web application with `grunt-retire`. Which of the following commands would enable `grunt` plugin?)

- A. `grunt-loadNpmTasks('grunt-retire');`
- B. `grunt.loadNpmTasks('grunt-retire');`
- C. `grunt.loadNpmTask('grunt-retire');`
- D. `grunt-loadNpmTask('grunt-retire');`

**Answer: B**

Explanation:

In Grunt, plugins installed via npm must be explicitly loaded in the Gruntfile to make their tasks available.

This is done using the `grunt.loadNpmTasks()` function, which instructs Grunt to load tasks provided by a specific plugin package.

For the `grunt-retire` plugin, which scans JavaScript libraries for known vulnerabilities, the correct command is `grunt.loadNpmTasks('grunt-retire');`. Options that omit the dot notation or use the singular form `loadNpmTask` are syntactically incorrect and will prevent the plugin from loading.

Enabling `grunt-retire` during the Code stage allows developers to identify insecure third-party JavaScript libraries early, supporting software composition analysis and reducing the risk of introducing vulnerable dependencies into the application.

### NEW QUESTION # 83

(Jordon Garrett has recently joined a startup IT company located in Chicago, Illinois, as a DevSecOps engineer. His team leader

asked him to find a SAST tool that can secure the organization Azure environment.  
Which of the following is a SAST tool that Jordon can select to secure his organization's Azure environment?.)

- A. Tenable.io.
- B. DevSkim.
- **C. Coverity.**
- D. Accurics.

**Answer: C**

Explanation:

Coverity is a well-known Static Application Security Testing (SAST) tool used to analyze source code for security vulnerabilities, coding errors, and quality issues. It integrates with CI/CD pipelines and supports enterprise-scale environments, including cloud-based development on platforms such as Azure. Accurics focuses on Infrastructure as Code security, Tenable.io is a vulnerability management platform for infrastructure and assets, and DevSkim is a lightweight code scanning extension rather than a full SAST platform. Selecting Coverity enables deep static analysis of application code during the Code stage, helping teams detect vulnerabilities early and reduce remediation costs.

#### NEW QUESTION # 84

(Charles Rettig has been working as a DevSecOps engineer in an IT company that develops software and web applications for IoT devices. He integrated Burp Suite with Jenkins to detect vulnerabilities and evaluate attack vectors compromising web applications. Which of the following features offered by Burp Suite minimizes false positives and helps detect invisible vulnerabilities?)

- A. QAST.
- B. MAST.
- C. NAST.
- **D. OAST.**

**Answer: D**

Explanation:

Burp Suite's Out-of-band Application Security Testing (OAST) feature is designed to detect vulnerabilities that do not produce immediate or visible responses during standard scanning. OAST works by triggering interactions such as DNS or HTTP callbacks, which occur outside the normal request-response cycle. This capability enables detection of blind vulnerabilities like blind SQL injection and server-side request forgery.

Because findings are based on confirmed external interactions, OAST significantly reduces false positives.

The other options listed are not valid Burp Suite features. Integrating OAST during the Build and Test stage improves the accuracy of dynamic security testing and ensures deeper coverage of complex and hard-to-detect vulnerability classes before applications are released.

#### NEW QUESTION # 85

(Dustin Hoffman has been working as a DevSecOps engineer in an IT company located in San Diego, California. For detecting new security vulnerabilities at the beginning of the source code development, he would like to integrate Checkmarx SCA tool with GitLab. The Checkmarx template has all the jobs defined for pipeline. Where should Dustin incorporate the Checkmarx template file '<https://raw.githubusercontent.com/Checkmarx-ltd/cx-flow/develop/templates/gitlab/v3/Checkmarx.gitlab-ci.yml>'?)

- A. `gitlab-cd.yml` root directory.
- **B. `gitlab-ci.yml` root directory.**
- C. `gitlab-ci/cd.yml` root directory.
- D. `gitlab.yml` root directory.

**Answer: B**

Explanation:

GitLab CI/CD pipelines are defined using a configuration file named `gitlab-ci.yml`, which must be placed in the root directory of the repository. This file controls pipeline stages, jobs, and template inclusions. To integrate Checkmarx SCA using a predefined

template, the template reference must be included in the root-level `gitlab-ci.yml` file so GitLab can load and execute the defined jobs automatically. The other filenames listed in the options are not recognized by GitLab as valid pipeline configuration files. Integrating SCA at the Code stage allows early detection of vulnerable open-source dependencies, reducing remediation cost and preventing insecure components from progressing further in the DevSecOps pipeline.
