Our Salesforce Certified Tableau Server Administrator study questions are suitable for a variety of levels of users, no matter you are in a kind of cultural level, even if you only have high cultural level, you can find in our Analytics-Admn-201 training materials suitable for their own learning methods. So, for every user of our study materials are a great opportunity, a variety of types to choose from, more and more students also choose our Analytics-Admn-201 Test Guide, then why are you hesitating? As long as you set your mind to, as long as you have the courage to try a new life, yearning for life for yourself, then to choose our Salesforce Certified Tableau Server Administrator study questions, we will offer you in a short period of time effective way to learn, so immediately began to revise it, don't hesitate, let go to do!

We also offer our customers with free updates of Salesforce Dumps for up to 365 days. Customers can also download a free demo to check the features of our Salesforce Certified Tableau Server Administrator (Analytics-Admn-201) practice material before making a purchase. The 24/7 support team is always available for your assistance in case of any hitch while using our Salesforce Analytics-Admn-201 Exam product. Buy updated Salesforce Certified Tableau Server Administrator (Analytics-Admn-201) practice material of ValidVCE now and become Salesforce Certified Tableau Server Administrator (Analytics-Admn-201) certified on the first attempt.

Pass Guaranteed 2026 Unparalleled Salesforce Analytics-Admn-201: Real Salesforce Certified Tableau Server Administrator Question

Our company was built in 2008 since all our education experts have more than ten years' experience in Analytics-Admn-201 guide torrent. The most important characters we pay attention on are our quality and pass rate. We devote ourselves to improve passing rate constantly and service satisfaction degree of our Analytics-Admn-201 training guide. And now you can find the data provided from our loyal customers that our pass rate of Analytics-Admn-201 learning guide is more than 98%. You will successfully pass your Analytics-Admn-201 exam for sure.

Salesforce Certified Tableau Server Administrator Sample Questions (Q21-Q26):

NEW QUESTION # 21

You attempt to delete a user who owns content on a Tableau Server. What is the result of the delete action?

- A. The user is deleted, and the user's content is reassigned to the server administrator
- B. The user and all of the user's content is deleted
- C. The user is deleted, and the user's content is reassigned to the project leader
- D. The user is switched to an Unlicensed site role and is NOT deleted

Answer: D

Explanation:

Deleting a user in Tableau Server involves handling their owned content (workbooks, data sources)-let's analyze the process:

* Deletion Rules:

* Ownership Check: Tableau prevents deletion if the user owns content to avoid orphaning it.

* Action: Instead of deleting, the user's site role is set to Unlicensed, retaining their account and content ownership.

* Resolution: An admin must reassign ownership (e.g., via Users > Actions > Change Owner) before deletion.

* Option D (User switched to Unlicensed and NOT deleted): Correct.

* Details: Attempting deletion (e.g., Users > Select User > Actions > Delete) triggers a check. If content exists, the user becomes Unlicensed-still in the system but unable to log in.

* Why: Protects data integrity-content remains accessible for reassignment.

* Option A (Deleted, content to server admin): Incorrect.

* Why: No automatic reassignment to the server admin-manual action is required first.

* Option B (Deleted, content to project leader): Incorrect.

* Why: Project leaders don't automatically inherit content-no such mechanism exists.

* Option C (User and content deleted): Incorrect.

* Why: Tableau avoids deleting content with the user-too destructive without explicit intent.

Why This Matters: This safeguard prevents accidental data loss, ensuring admins manage ownership transitions deliberately.

NEW QUESTION # 22

What should you use to set a preferred active repository?

- A. The TSM browser client's Maintenance page
- B. The TSM browser client's Configuration Topology page
- C. A tabcmd set command
- **D. A tsm configuration set command**

Answer: D

Explanation:

Tableau Server uses a PostgreSQL database as its repository to store metadata, user information, and permissions. In a high-availability (HA) setup with multiple nodes, there are typically two repository instances: one active and one passive. The "preferred active repository" refers to designating which repository instance should take priority as the active one. This is managed through Tableau Services Manager (TSM).

The correct method to set the preferred active repository is by using the tsm configuration set command.

Specifically, you would use a command like:

```
tsm configuration set -k postgresql.preferred_host -v <hostname>
```

This command allows an administrator to specify the preferred host for the active repository, ensuring control over which node takes precedence in an HA environment.

Option B (tabcmd set command) is incorrect because tabcmd is a command-line utility primarily used for administrative tasks like managing users, groups, and content (e.g., publishing workbooks), not for configuring server topology or repository settings.

Option C (TSM browser client's Maintenance page) is incorrect because the Maintenance page in the TSM web interface is used for tasks like backups, restores, and cleanup, but it does not provide an option to set the preferred active repository.

Option D (TSM browser client's Configuration Topology page) is partially relevant since the Topology page displays the current configuration of services across nodes, including the repository. However, it does not allow direct modification of the preferred active repository; this must be done via the tsm command line.

Reference: Tableau Server Documentation - "Configure Tableau Server Repository" (<https://help.tableau.com/current/server/en-us/repository.htm>) and "TSM Command Line Reference" (https://help.tableau.com/current/server/en-us/cli_configuration_set.htm).

NEW QUESTION # 23

Which three methods should an administrator use to create a Tableau Server group or project? (Choose three.)

- A. tsm customize
- **B. Tableau Server browser interface**
- **C. REST API**

- **D. tabcmd**

Answer: B,C,D

Explanation:

Tableau Server provides multiple methods to create groups (collections of users) and projects (content containers), catering to UI, CLI, and programmatic needs. Let's dissect each option with depth:

* Option B (Tableau Server browser interface): Correct.

* Groups: Go to Users > Groups > Add Group, name it, and optionally sync with Active Directory.

* Projects: Go to Content > Projects > New Project, set name, description, and permissions.

* Details: The web UI is intuitive, requiring server/site administrator rights. It's ideal for manual, ad-hoc creation with immediate visibility.

* Permissions: For projects, you can set default permissions or lock them here.

* Option C (tabcmd): Correct.

* Groups: `tabcmd creategroup "GroupName"` creates a local group. Add users with `tabcmd addusers "GroupName" --users "user1,user2"`.

* Projects: `tabcmd createproject -n "ProjectName" -d "Description"` creates a project.

* Details: `tabcmd` is a command-line tool for batch operations or scripting (e.g., automating group/project setup). It requires a server admin login (`tabcmd login`).

* Limitation: No AD sync via `tabcmd`-that's UI or REST API territory.

* Option D (REST API): Correct.

* Groups: Use the `POST /api/api-version/sites/site-id/groups` endpoint with a payload (e.g., `{ "group": { "name": "GroupName" } }`). Supports AD import too.

* Projects: Use `POST /api/api-version/sites/site-id/projects` (e.g., `{ "project": { "name": "ProjectName", "description": "Desc" } }`).

* Details: The REST API is programmatic, ideal for integration with external systems or bulk automation. Requires authentication via a token and server/site admin rights.

* Power: Offers full control, including nested projects and custom permissions.

* Option A (tsm customize): Incorrect.

* Purpose: `tsm customize` modifies TSM UI branding (e.g., logos, colors) via commands like `tsm customize --logo "path/to/logo.png"`.

* Why Wrong: It's unrelated to creating groups or projects-it's for cosmetic server configuration, not content/user management.

Why This Matters: Offering UI, CLI, and API options ensures flexibility-manual for small tasks, automation for scale-critical in enterprise deployments.

NEW QUESTION # 24

A user named John publishes a workbook named Sales Quota to a project named Sales. The All Users group has the View and Download Workbook/Save As capabilities only to the Sales project. A user named Sandy has the Explorer (can publish) site role, on the Sales Quota workbook. No other users or groups have permissions to the Sales project. The Sales project is set to Managed by the owner. What are the effective rights for Sandy?

- **A. View and Download Workbook/Save As**
- B. The same rights as John
- C. All of the capabilities associated with the Editor rule
- D. No access

Answer: A

NEW QUESTION # 25

You have an installation of Tableau Server and a site that are configured to use default settings. What should you do to ensure that the users on the site can set up data-driven alerts?

- A. Enable data-driven alerts on the Tableau Services Manager Configuration page
- B. Run the `tsm configuration set -k dataAlerts.checkIntervallnMinutes -v 60` command

- C. No action is necessary: the default settings enable data-driven alerts for the site
- **D. Change the data-driven alerts setting on the new site's Settings page**

Answer: D

Explanation:

Data-driven alerts in Tableau Server allow users to receive notifications when data in a view meets certain conditions (e.g., a sales metric exceeds a threshold). By default, this feature is disabled for a site unless explicitly enabled by an administrator.

Option C (Change the data-driven alerts setting on the new site's Settings page): This is the correct answer. In the Tableau Server web interface, a site administrator can navigate to the site's Settings > General page and enable the option "Let users create data-driven alerts." This must be done manually because the default setting for a new site is disabled. Once enabled, users with appropriate permissions (e.g., Viewer, Explorer, or Creator roles) can create alerts on views they have access to.

Option A (Enable data-driven alerts on the TSM Configuration page): This is incorrect because the TSM Configuration page (accessed via the TSM web UI or CLI) manages server-wide settings like ports, authentication, and processes, not site-specific features like data-driven alerts.

Option B (Run the tsm configuration set -k dataAlerts.checkIntervalInMinutes -v 60 command): This is incorrect. The dataAlerts.checkIntervalInMinutes key controls how frequently Tableau Server checks alert conditions (default is 60 minutes), but it does not enable the feature itself. The feature must first be turned on at the site level.

Option D (No action is necessary): This is incorrect because the default setting for data-driven alerts is off for new sites, requiring explicit action to enable it.

Reference: Tableau Server Documentation - "Configure Data-Driven Alerts" (https://help.tableau.com/current/server/en-us/data_alerts.htm).

NEW QUESTION # 26

.....

In the course of your study, the test engine of Analytics-Admn-201 actual exam will be convenient to strengthen the weaknesses in the learning process. This can be used as an alternative to the process of sorting out the wrong questions of Analytics-Admn-201 learning guide in peacetime learning, which not only help you save time, but also makes you more focused in the follow-up learning process with our Analytics-Admn-201 learning materials.

New Analytics-Admn-201 Test Pattern: <https://www.validvce.com/Analytics-Admn-201-exam-collection.html>
