Updated Questions NCP-MCA Exam Help You to Get Acquainted with Real

NCP-MCA Exam Simulation

You surely desire the NCP-MCA certification. So with a tool as good as our NCP-MCA exam material, why not study and practice for just 20 to 30 hours and then pass the examination? With our great efforts, our NCP-MCA study materials have been narrowed down and targeted to the examination. So you don't need to worry about wasting your time on useless NCP-MCA Exam Materials information. We can ensure you a pass rate as high as 98% to 100%.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q29-Q34):

NEW QUESTION # 29

Exhibit.

An administrator must launch applications deployments on any remote Prism Central (PC) from the PC hosting Calm Global. What must the administrator do to satisfy this requirement?

- A. Create a Nutanix account for each remote PC on the local PC and add the accounts to the project.
- B. Create a Nutanix account for any remote PC on Calm Global and add the account to the project.
- C. Create a Nutanix account for each remote PE on the local PC and add the accounts to the project.
- D. Create a Nutanix account any remote PE on Calm Global and add the account to the project.

Answer: A

Explanation:

To launch application deployments on any remote Prism Central (PC) from the PC hosting Calm Global, the administrator must create a Nutanix account for each remote PC on the local PC (the one hosting Calm Global) and add these accounts to the relevant project. This setup allows Calm to manage and orchestrate resources across multiple Prism Central instances.

NEW QUESTION # 30

What action will be performed if the VM named ORACLE gets CPU constrained?

- A. The playbook will add vCPU and send an email.
- B. The playbook will send an email.
- C. The playbook will add more vCPU and will send a Slack message.
- D. The playbook will fail to add more vCPU and will send a Slack message.

Answer: C

Explanation:

In Nutanix's Multicloud Automation (formerly known as Calm), playbooks can be configured to respond to various conditions and events that occur within the infrastructure. If a VM, such as one named ORACLE, becomes CPU constrained, a playbook can be triggered to automatically add more virtual CPUs (vCPUs) to the VM. In addition, playbooks can integrate with various notification services such as Slack, allowing administrators to be informed of the changes being made.

Based on the provided options and according to Nutanix documentation, the correct action is that the playbook will add more vCPU and will send a Slack message. This ensures that the VM's performance can be adjusted dynamically while keeping the

relevant personnel informed via Slack.

NEW QUESTION # 31

Where would a Calm administrator find the archived application logs within Prism Central?

- A. Services > Calm > Projects
- B. Services > Calm > Applications
- C. Services > Calm > Blueprints
- D. Services > Calm > Settings

Answer: D

Explanation:

The archived application logs within Prism Central can be found under Services > Calm > Settings. Calm automatically archives run logs of the deleted applications and custom actions that are older than three months. The administrator can download the archives within 7 days from the time of archive creation. For a running application, data is not archived for the system-generated Create actions. NEW QUESTION # 32

What are the proper steps to create a Playbook?

- A. 1. Access Intelligent Operations
2. Create the playbook
3. Select the playbook trigger
4. Select the playbook action(s)
5. Save & Close
- B. 1. Access Intelligent Operations
2. Create the playbook
3. Select the playbook action
4. Select the playbook trigger(s)
5. Save & Close
- C. 1. Access Self Service
2. Create the playbook
3. Select the playbook action
4. Select the playbook trigger(s)
5. Save & Close
- D. 1. Access Self Service
2. Create the playbook
3. Select the playbook trigger
4. Select the playbook action(s)
5. Save & Close

Answer: A

Explanation:

Playbooks are a feature of Intelligent Operations (formerly Prism Pro or X-Play), not Nutanix Self-Service (formerly Calm). Therefore, the first step is always to access the Intelligent Operations console in Prism Central.

The logical flow for defining an automation routine in a Playbook is Trigger first, then Action.

* Select Trigger: The administrator must first define when the playbook runs (e.g., on an Alert, an Event, or Manually).

* Add Actions: Once the trigger is established, the administrator defines what happens (e.g., Power off VM, Send Email, Slack Notification).

The correct order found in the Nutanix Intelligent Operations Guide is: Access Intelligent Operations > Create Playbook > Select Trigger > Add Actions > Save.

NEW QUESTION # 33

The administrator has already added the power off and power on actions to the new playbook. Which two additional playbook actions should the administrator add? (choose two.)

- A. VMs do not support hot add
- **B. VM Add CPU Action with limits**
- C. VM Add CPU with no Limit
- D. Send Alert to ServiceNow Action
- **E. VM Add Memory Action**

Answer: B,E

Explanation:

To manage and optimize the performance of virtual machines (VMs) within a playbook, administrators often need to adjust the resources allocated to VMs. Here are the appropriate actions:

* VM Add Memory Action: This action allows the administrator to increase the memory allocation to a VM, which can be essential for applications requiring more RAM.

* VM Add CPU Action with limits: Adding CPUs with defined limits ensures that the VM receives the necessary CPU resources without exceeding the cluster's capacity.

These actions enable the dynamic scaling of resources, improving VM performance and ensuring resource availability.
