Test Salesforce Mule-Dev-202 Engine Version - Mule-Dev-202 Trustworthy Source

After the user has purchased our Mule-Dev-202 learning materials, we will discover in the course of use that our product design is extremely scientific and reasonable. Details determine success or failure, so our every detail is strictly controlled. For example, our learning material's Windows Software page is clearly, our Mule-Dev-202 Learning material interface is simple and beautiful. There are no additional ads to disturb the user to use the Salesforce Certified MuleSoft Hyperautomation Developer qualification question. Once you have submitted your practice time, Mule-Dev-202 study tool system will automatically complete your operation.

Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q61-Q66):

NEW QUESTION # 61

The MuleSoft team at Northern Trail Outfitters wants to create a project skeleton that developers can use as a starting point when creating API implementations with Anypoint Studio. This will help drive consistent use of best practices within the team. Which type of Anypoint Exchange artifact should be added to Exchange to publish the project skeleton?

- A. A custom asset with the default API implementation
- B. RAML trail definitions to be reused across API implementations
- **C. A MuleSoft application template with key components**
- D. An example of an API implementation following best practices

Answer: C

Explanation:

To create a project skeleton that developers can use as a starting point for API implementations with Anypoint Studio, the best approach is to use a MuleSoft application template:

MuleSoft Application Template:

A MuleSoft application template includes key components and configurations that follow best practices. It provides a consistent starting point for new projects, ensuring that all developers adhere to the same standards.

Benefits:

Using a template helps enforce best practices, reduces the setup time for new projects, and ensures consistency across different implementations.

Publishing to Anypoint Exchange:

Once the template is created, it can be published to Anypoint Exchange where it is accessible to the entire development team. Developers can then use this template to kickstart their API projects, ensuring a uniform approach across the organization.

NEW QUESTION # 62

AnyAirlines is developing an RPA process to extract information from a legacy system. To capture the manual workflow, they leverage RPA Recorder.

Which two best practices should they be aware of when working with the autogenerated workflow code?

(Choose two.)

- **A. Some autogenerated code must be replaced with more robust or specialized action steps.**
- B. All autocaptured information is for documentation purposes only.
- **C. The autogenerated workflows may contain sensitive information that must be removed.**
- D. All keystrokes and mouse clicks in the autogenerated code must be disabled before deploying to production.

Answer: A,C

Explanation:

When developing an RPA process using RPA Recorder, it is essential to be mindful of the following best practices concerning the autogenerated workflow code:

Replace Autogenerated Code:

Robustness: Some of the autogenerated code may not be optimized for robustness or specific use cases. It is often necessary to review and replace parts of the autogenerated workflow with more robust or specialized action steps to ensure reliability and accuracy.

Specialization: Customizing the workflow to fit the specific requirements of the process can improve performance and handle exceptions better.

Remove Sensitive Information:

Sensitive Data: Autogenerated workflows might capture sensitive information such as usernames, passwords, or other confidential data. It is crucial to identify and remove or mask this information before deploying the RPA process to production to maintain security and compliance.

Compliance: Ensuring that sensitive information is handled appropriately helps in adhering to data protection regulations and organizational policies.

NEW QUESTION # 63

An RPA process is invoked by a MuleSoft Composer flow. The RPA process has a User Task that can take up to 24 hours to

complete.

- A. Create a second MuleSoft Composer flow that runs on a schedule and checks if the RPA process is complete.
- B. Wait for the RPA process to complete and invoke a second MuleSoft Composer flow via REST API.
- **C. Create a second MuleSoft Composer flow that starts when the RPA process is complete.**
- D. Wait for the RPA process to complete and use the results in the same MuleSoft Composer flow.
- E. Using best practices, how should the results be consumed by MuleSoft Composer?

Answer: C

Explanation:

When an RPA process involves a User Task that can take a significant amount of time (up to 24 hours) to complete, it is best to use a follow-up mechanism to handle the results once the process is finished:

Second MuleSoft Composer Flow:

Create a second MuleSoft Composer flow that is triggered when the RPA process completes. This ensures that the first flow is not held up while waiting for the long-running RPA process to finish.

The second flow can start based on an event, such as the completion status of the RPA process, ensuring timely and efficient processing of the results.

Trigger Mechanism:

Configure the RPA process to notify MuleSoft Composer when it is complete, possibly using a REST API or another integration method.

Best Practices:

This approach adheres to best practices by keeping flows modular and focused on specific tasks, making them easier to manage and troubleshoot.

NEW QUESTION # 65

Which MuleSoft deployment strategy consists of the control plane and runtime plan hosted by the client?

- A. Runtime Fabric
- B. IPrivate Cloud Edition
- **C. Hybrid**
- D. CloudHub

Answer: C

Explanation:

A hybrid deployment strategy in MuleSoft involves hosting the control plane (Anypoint Platform management and design tools) in the cloud, while the runtime plane (where Mule applications run) is hosted by the client, either on-premises or in their own private cloud:

Hybrid Deployment:

The control plane is managed by MuleSoft and provides centralized management, monitoring, and deployment capabilities.

The runtime plane is hosted by the client, providing flexibility and control over where and how the Mule applications are executed, whether on-premises or in a private cloud environment.

Benefits:

This approach combines the advantages of cloud-based management with the control and customization available in on-premises or private cloud deployments, making it suitable for organizations with specific hosting and compliance requirements.
