Feel free to reach our customer support team if you have any questions about our B2B-Commerce-Developer Exam Preparation material.

Salesforce Accredited B2B Commerce Developer Sample Questions (Q136-Q141):

NEW QUESTION # 136

Which method needs to be implemented when rendering a Salesforce B2B Commerce view in order to have it called after rendering has finished?

- **A. postRender()**
- B. There are no methods called on the view after rendering has finished
- C. onRender()
- D. afterRender()

Answer: A

Explanation:

The method that needs to be implemented when rendering a Salesforce B2B Commerce view in order to have it called after rendering has finished is postRender. This method is an optional hook that can be defined by the user to perform any actions or logic that depend on the view being rendered, such as initializing widgets, binding events, or updating the user interface. The method will be called by the render method of the CCRZ.View class, which is the base class for all views in the framework. NEW QUESTION # 137

Ursa Major is planning to implement Salesforce B2B Commerce, and a developer needs to configure taxes for their storefront. The company operates in multiple states, each with different tax rates and tax rules. What are two ways the developer should configure taxes in B2B Commerce?

- A. Use a different pricebook for each state.
- B. Use the Salesforce out-of-the-box tax calculator.
- **C. Configure a tax engine using third-party software.**
- **D. Configure tax rates and rules for each state in Salesforce B2B Commerce.**

Answer: C,D

Explanation:

Two ways that a developer should configure taxes in B2B Commerce for Ursa Major are: configure a tax engine using third-party software and configure tax rates and rules for each state in Salesforce B2B Commerce. Configuring a tax engine using third-party software allows the developer to integrate with an external tax service provider that can calculate and apply accurate and up-to-date tax rates and rules for different states and jurisdictions. The developer can use the sfdc_checkout.TaxCalculations interface or the RegisteredExternalService object to connect to the third-party tax service provider's API or service. Configuring tax rates and rules for each state in Salesforce B2B Commerce allows the developer to implement their own custom tax calculation logic using Apex code. The developer can use custom objects, such as TaxRate__c and TaxRule__c, to store and manage tax rates and rules for different states and products. The developer can also use the sfdc_checkout.TaxCalculations interface to define how to retrieve and apply tax rates and rules for a cart or an order. Using a different pricebook for each state is not a good way to configure taxes in B2B Commerce, as it can create complexity and inconsistency in pricing and discounting logic. Using the Salesforce out-of-the-box tax calculator is not a good way either, as it does not support complex or dynamic tax scenarios that may vary by state or jurisdiction. NEW QUESTION # 138

What is a valid way of referencing the CC Cart Object whose API name is E_Cart__c in a SOQL query?

- **A. ccrz__E_Cart__c**
- B. _Cart__c
- C. cloudcraze__E_Cart__c
- D. c.E_Cart__c

Answer: A

Explanation:

A valid way of referencing the CC Cart Object whose API name is E_Cart__c in a SOQL query is to use ccrz__E_Cart__c. This is the transformed name of the object that is used by the Salesforce B2B Commerce framework. All custom objects and fields that are part of the cloudcraze managed package have the prefix ccrz__ in their API names. For example, SELECT Id, Name FROM ccrz__E_Cart__c will query the CC Cart Object records. Salesforce References: B2B Commerce and D2C Commerce Developer Guide, Query Transformation

NEW QUESTION # 139

Which two scoped modules should a developer import in Lightning web components to check user permissions?

- A. `@salesforce/customPermission`
- B. `@salesforce/hasPermission`
- C. `@salesforce/userPermission`
- D. `@salesforce/permission`

Answer: A,D

Explanation:

To check user permissions in Lightning web components, a developer should import two scoped modules:

`@salesforce/permission` and `@salesforce/customPermission`. The `@salesforce/permission` module allows the developer to check if the user has access to a standard permission, such as View Setup or Modify All Data.

The `@salesforce/customPermission` module allows the developer to check if the user has access to a custom permission, such as Enable Debug Mode or Manage Orders. The other modules do not exist or are not related to user permissions. Salesforce

NEW QUESTION # 140

What are three advantages of using `ccLog` over the Salesforce standard `System.debug` class? (3 answers)

- A. There is no need to create a User Trace Flag.
- B. Append `#ccLog=<Logging Token Name>` to the end of the storefront URL in order to get logs in the inspector console.
- C. `ccLog` can debug syntax errors found in the JavaScript.
- D. There is no need to manually set a cookie to debug with the Site Guest User.
- E. There is no need to use string concatenation to easily tag log statements with a subject.

Answer: B,D,E

Explanation:

Three advantages of using `ccLog` over the Salesforce standard `System.debug` class are:

There is no need to use string concatenation to easily tag log statements with a subject. `ccLog` allows passing a subject parameter to the log method, which will prepend the subject to the log message. For example, `ccLog.log('This is a message', 'Subject')` will log `[Subject] This is a message`.

There is no need to create a User Trace Flag. `ccLog` can be enabled by setting the value of `CO.logToken` to true in `CCAdmin`, which will activate logging for all users who access the storefront.

There is no need to manually set a cookie to debug with the Site Guest User. `ccLog` can be enabled for the Site Guest User by appending `#ccLog=<Logging Token Name>` to the end of the storefront URL in order to get logs in the inspector console. For example, `https://my-storefront.com/#ccLog=debug` will enable logging for the Site Guest User with the debug level. Salesforce Reference: B2B Commerce and D2C Commerce Developer Guide, Logging
