Es ist schwierig, Oracle 1z1-076 Zertifizierungsprüfung zu bestehen. Sorgen Sie sich um die Vorbereitung der 1z1-076 Prüfung nach der Anmeldung? Wenn ja, lesen Sie bitte die folgenden Inhalte. Sie können den kürzesten Weg zum Erfolg der 1z1-076 Prüfung finden, der Ihnen helfen, Oracle 1z1-076 Prüfung mit guter Note bestanden. Das ist ja Oracle 1z1-076 Dumps von PrüfungFrage. Wenn Sie diese 1z1-076 Prüfung sehr leicht bestehen wollen, probieren Sie bitte diese Dumps.

Wenn Sie in kurzer Zeit mit weniger Mühe sich ganz effizient auf die Oracle 1z1-076 Zertifizierungsprüfung vorbereiten, benutzen Sie doch schnell die Schulungsunterlagen zur Oracle 1z1-076 Zertifizierungsprüfung. Sie werden von der Praxis bewährt. Viele Kandidaten haben bewiesen, dass man mit der Hilfe von PrüfungFrage die Prüfung 100% bestehen können. Mit PrüfungFrage können Sie Ihr Ziel erreichen und die beste Effekte erzielen.

1z1-076 Examengine & 1z1-076 Fragenpool

Wir PrüfungFrage bieten Ihnen die freundlichsten Kundendienst. Nach der Kauf der Oracle 1z1-076 Prüfungssoftware, bieten wir Ihnen kostenlosen Aktualisierungsdienst für ein voll Jahr, um Sie die neusten und die umfassendsten Unterlagen der Oracle 1z1-076 wissen zu lassen. Darum werden Sie sehr sicher sein, die Zertifizierungstest der Oracle 1z1-076 zu bestehen. Falls Sie unglücklich die Test der Oracle 1z1-076 nicht bei der ersten Proben bestehen, geben wir Ihnen die vollständige Gebühren zurück, um Ihren finanziellen Verlust zu entschädigen.

Oracle Database 19c: Data Guard Administration 1z1-076 Prüfungsfragen mit Lösungen (Q61-Q66):

61. Frage

You created a physical standby database prodsbyi from the primary database prod using SQL and RMAN. Which THREE are prerequisites for creating a Data Guard Broker configuration to manage these databases?

- A. The primary database must have supplemental logging enabled.
- B. The standby database must have supplemental logging enabled.
- C. The LOG_ARCHIVE_DEST_n parameters with the service attribute set must be cleared.
- D. The DG_BROKER_START parameter must be set to TRUE for both database instances.
- E. The primary database must have FORCE LOGGING enabled.
- F. A local net service name to enable connectivity to the PRODSBYI database instance must be defined on the primary database host.

Antwort: A,D,F

Begründung:

When setting up a Data Guard Broker configuration for a primary database and its physical standby, the following prerequisites must be met:

A: Oracle Net connectivity must be defined on both the primary and standby hosts to enable the respective database instances to communicate with each other.

B: Supplemental logging is required on the primary database because it provides additional logging necessary for the standby database to be able to apply changes from the primary database accurately.

F: The DG_BROKER_START parameter must be set to TRUE for both the primary and standby database instances. This parameter is used to start the Data Guard Broker process which manages the configuration.

Options C and D are not prerequisites for creating a Data Guard Broker configuration. Additionally, while FORCE LOGGING mode (option E) is recommended as a best practice to prevent possible data inconsistencies during media recovery, it is not a strict prerequisite for creating a Data Guard Broker configuration.

62. Frage

Which TWO are benefits of using Transaction Guard in a Data Guard environment?

- A. It protects against logical corruptions being replicated to standby databases.
- B. It protects against user errors being replicated to standby databases.
- C. It protects against recoverable errors during a planned or an unplanned outage of a primary database.
- D. It provides application continuity by replaying transactions interrupted by a failover or a switchover
- E. It provides application continuity by rolling back uncommitted transactions interrupted by a failover or switchover.

Antwort: C,E

Begründung:

Transaction Guard provides benefits in terms of transaction consistency and recovery in a Data Guard environment:

It provides application continuity by rolling back uncommitted transactions interrupted by a failover or switchover (B): Transaction Guard ensures that any uncommitted transactions at the time of an outage are rolled back consistently, thus preserving the integrity of the application's data and state.

It protects against recoverable errors during a planned or an unplanned outage of a primary database (D): Transaction Guard offers protection against errors that can occur during outages, allowing applications to resume operations more quickly and reliably after recovery.

63. Frage

Your Data Guard environment has one physical standby database using Real-Time Query. Two sequences have been created by these SQL statements:

```
create sequence a global;  
create sequence b session;
```

Neither sequence has been used since being created.

Session 1 connects to the primary database instance and issues these two SQL statements:

SELECT a.nextval FROM DUAL; SELECT b.nextval FROM DUAL;

Then session 2 connects to the physical standby database instance and issues the same SQL statements. Which output will be seen for session 2?

Then session 2 connects to the physical standby database instance and issues the same SQL statements. Which output will be seen for session 2?

A)

Sequence	1
a output	1
Sequence	1
b output	1

B)

C)

- A. Option A
- B. Option D
- **C. Option C**
- D. Option B

Antwort: C

Begründung:

In Oracle, a sequence created with the GLOBAL keyword is available and can produce values across all sessions and instances. However, a sequence created with the SESSION keyword is only specific to the session it was created in. When the NEXTVAL is called for a sequence, it will increment according to the sequence's properties set during its creation.

Given the sequence creation statements and the actions performed:

The a sequence is global, which means it is available across the entire database, including the standby database with Real-Time Query enabled. So, when session 2 calls a.nextval, it will get the next value in the sequence, which is 21 since session 1 already retrieved 1.

The b sequence is session-specific, so when session 2 calls b.nextval, it will get the value 1 because for this new session on the standby, this is the first time the sequence is being accessed.

Therefore, the output for session 2 will be a output as 21 and b output as 1, which corresponds to Option C.

64. Frage

Which THREE steps are prerequisites for the creation of a physical standby database on a separate server using the RMAN active database duplication method?

- A. Put the primary database into archivelog mode.
- B. Set the DB_UNIQUE_NAME parameter on the primary database to a different value than that of the DB_NAME name parameter.
- **C. Establish user equivalence for the database software owner between the primary host and standby host.**
- **D. Configure Oracle Net connectivity on the primary host to the standby database instance.**
- **E. startup nomount the standby database instance.**

Antwort: C,D,E

Begründung:

Creating a physical standby database using RMAN active database duplication requires certain prerequisites to ensure a successful and seamless operation:

* Configure Oracle Net connectivity on the primary host to the standby database instance (A):

* Proper Oracle Net connectivity between the primary and standby servers is essential for communication and data transfer during the duplication process. Oracle Net services provide the network foundation for Oracle Database, Oracle Net Listener, and Oracle applications.

* Establish user equivalence for the database software owner between the primary host and standby host (B): User equivalence ensures that the user who owns the Oracle Database software on the primary server has the same privileges on the standby server. This is crucial for RMAN to perform operations on both servers without encountering permission issues.

* Startup nomount the standby database instance (C): The standby database instance needs to be started in the NOMOUNT stage before the duplication can begin. This prepares the environment for creating the control file and restoring the database without mounting it, which is a necessary step in the RMAN duplication process.

65. Frage

Which three statements are true..... With no Oracle Streams or Goldengate configured?

- A. They are required on a logical standby for real-time apply
- B. It is recommended to have them on the...
- C. The LGWR process writes to them on
- D. Only standby databases can write redo....
- E. They are required on a physical standby for real-time apply.
- F. They are required only for synchronous redo transport

Antwort: A,C,E

Begründung:

C; The LGWR (Log Writer) process is responsible for writing redo entries from the redo log buffer to the online redo log files on the primary database. This is a fundamental process in the Oracle Database architecture, ensuring that all changes made to the database are captured for purposes such as recovery, replication, and high availability.

D; Real-time apply on a logical standby database requires standby redo log files. The standby redo log files are used to store redo data received from the primary database before it is applied to the logical standby database.

This enables the logical standby to apply changes as they are received, without waiting for the current redo log file to be archived.

E: Similarly, on a physical standby database, standby redo log files are used for real-time apply. They store redo data from the primary database, allowing the physical standby to apply redo data concurrently as it is received, rather than waiting for redo log files to be archived. This capability is crucial for maintaining a physical standby database that is closely synchronized with the primary database with minimal lag.

These functionalities are integral to Oracle Data Guard configurations and are not dependent on Oracle Streams or Oracle GoldenGate, which are separate technologies for data replication and integration.

66. Frage

.....

Haben Sie keine gute Methode, Oracle 1z1-076 Zertifizierungsprüfungen vorzubereiten? Oracle 1z1-076 Zertifizierungsprüfung ist eine der bedeutendsten Zertifizierung bei IT-Zertifizierungen. Seit Jahren hat IT-Branchen die Aufmerksamkeit der ganzen Welt gewonnen. Und es wird auch ein unverzichtbarer Bestandteil des modernen Lebens. Und Oracle Zertifizierungen sind schon international anerkannt. Deshalb entwickeln viele IT-Fachleute ihre Kenntnisse und Fähigkeiten durch Oracle exam. Und 1z1-076 Zertifizierungsprüfung ist eine der wichtigsten Prüfung. Diese Zertifizierung kann Leuten größere Interessen bringen.
