Salesforce PDI, or Platform Developer I, is a certification exam designed to test an individual's proficiency in Salesforce development. PDI exam evaluates a candidate's ability to create custom objects, formula fields, and workflow rules while applying best practices and accommodating platform limits. Passing the exam demonstrates the candidate's knowledge of the Salesforce platform and their ability to develop simple yet robust solutions that meet client requirements.

Earning the Salesforce PDI certification can be a valuable asset for developers looking to advance their careers in the Salesforce ecosystem. Not only does it validate their skills and knowledge, but it also demonstrates their commitment to professional development and staying up-to-date with the latest developments in the platform. With the demand for Salesforce developers on the rise, earning the PDI Certification can also help developers stand out in a competitive job market and open up new opportunities for career growth and advancement.

Salesforce PDI certification exam is a 105-minute exam consisting of 60 multiple-choice questions. PDI exam is administered by Salesforce and is available in English, Japanese, and Spanish. PDI exam is computer-based and can be taken at one of the many testing centers located around the world. PDI exam covers a range of topics such as Apex programming, Visualforce development, data modeling, and database design, among others.

Salesforce Platform Developer I (PDI) Sample Questions (Q129-Q134):

NEW QUESTION # 129

A developer needs to join data received from an integration with an external system with parent records in Salesforce. The data set does not contain the Salesforce IDs of the parent records, but it does have a foreign key attribute that can be used to identify the parent.

Which action will allow the developer to relate records in the data model without knowing the Salesforce ID?

- A. Create and populate a custom field on the parent object marked as Unique.

- B. Create a custom field on the child object of type External Relationship.
- C. Create and populate a custom field on the parent object marked as an External ID.
- D. Create a custom field on the child object of type Foreign Key.

Answer: D

NEW QUESTION # 130

An after trigger on the Account object performs a DML update operation on all of the child Opportunities of an Account. There are no active triggers on the Opportunity object, yet a "maximum trigger depth exceeded" error occurs in certain situations. Which two reasons possibly explain the Account trigger firing recursively? (Choose two.)

- A. Changes are being made to the Account during an unrelated parallel save operation.
- B. Changes are being made to the Account during Criteria Based Sharing evaluation.
- C. Changes to Opportunities are causing roll-up summary fields to update on the Account.
- D. Changes to Opportunities are causing cross-object workflow field updates to be made on the Account.

Answer: C,D

NEW QUESTION # 131

A developer at AW Computing is tasked to create the supporting test class for programmatic customization that leverages records stored within the custom object, Pricing_Structure__c. AW Computing has a complex pricing structure for each item on the store, spanning more than 500 records. Which two approaches can the developer use to ensure Pricing_Structure__c records are available when the test class is executed?

Choose 2 answers

- A. Use without sharing on the class declaration.
- B. Use the Test.loadData() method.
- C. Use a Test Data Factory class.
- D. Use the @Test(SeeAllData=true) annotation.

Answer: B,C

Explanation:

To ensure Pricing_Structure__c records are available when the test class is executed, the developer can use the following approaches:

Option A: Use a Test Data Factory class.

Valid Approach.

A Test Data Factory class is a utility class that creates test data for use in test methods.

It helps in generating consistent test data and promotes reusability.

The factory class can create the necessary Pricing_Structure__c records for testing.

Test.loadData() allows loading test data from a static resource (CSV file) into test methods.

This is useful for loading large datasets, such as over 500 records.

The CSV file can contain the Pricing_Structure__c records needed for testing.

Using SeeAllData=true accesses existing org data, which is not recommended due to test data isolation.

Tests should create their own data to ensure reliability and avoid dependencies on org data.

The without sharing keyword affects record sharing and visibility, not data availability in tests.

It does not help in creating or accessing test data.

Reference:

Test Data Factory Pattern

Best Practices for Test Classes

Option B: Use the Test.loadData() method.

Valid Approach.

Test.loadData Method

Using Test.loadData()

Incorrect Options:

Option C: Use the @IsTest(SeeAllData=true) annotation.

Not Recommended.

Isolation of Test Data from Organization Data in Unit Tests

Option D: Use without sharing on the class declaration.

Irrelevant.

Using the with sharing or without sharing Keywords

Conclusion:

To ensure Pricing_Structure__c records are available in tests, the developer can use Option A (Test Data Factory) and Option B (Test.loadData()).

NEW QUESTION # 132

Which two actions may cause triggers to fire?

Choose 2 answers

- A. Changing a user's default division when the transfer division option is checked
- B. Renaming or replacing a picklist entry
- C. Cascading delete operations
- D. Updates to FeedItem

Answer: C,D

Explanation:

B: Updates to FeedItem:

Triggers can fire when FeedItem records are updated, such as posts on records or Chatter updates.

C: Cascading delete operations:

When a parent record is deleted, cascading delete operations on related child records can trigger child object triggers.

Why Not Other Options?

A: Changing a user's default division does not fire triggers.

D: Renaming or replacing a picklist entry does not fire triggers.

NEW QUESTION # 133

A developer created a trigger on a custom object. This custom object also has some dependent pick lists.

According to the order of execution rules, which step happens first?

- A. System validation is run for maximum field lengths.
- B. JavaScript validation is run in the browser.
- C. Old values are overwritten with the new record values.
- D. The original record is loaded from the database.

Answer: B
