ISTQB Certified Tester Foundation Level (CTFL v4.0) exam simulators & ISTQB-CTFL exam torrent

Do you want to have a new change about your life? If your answer is yes, it is high time for you to use the ISTQB-CTFL question torrent from our company. As the saying goes, opportunities for those who are prepared. If you have made up your mind to get respect and power, the first step you need to do is to get the ISTQB-CTFL Certification, because the certification is a reflection of your ability. If you have the ISTQB-CTFL certification, it will be easier for you to get respect and power. Our company happened to be designing the ISTQB-CTFL exam question.

ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q345-Q350):

NEW QUESTION # 345

Which is an advantage of using testers that are independent from the development team?

- A. Independent testers will identify themselves more with the project and the project goals and have good relations with the development team
- B. Independent testers support the developers with their feedback on coding rules and architecture design.
- C. Independent testers have a different perspective and can find defects that developers miss.

- D. Developers can delegate their sense of responsibility for quality to testers.

Answer: C

NEW QUESTION # 346

Which ONE of the following options MOST ACCURATELY describes branch testing?

- A. In branch testing, the coverage items are branches, and the aim is to design test cases to exercise branches in the code until an acceptable level of coverage is achieved. Coverage is measured as the number of branches exercised by the test cases divided by the total number of branches expressed as a percentage.
- B. In branch testing, the coverage items are executable statements. The aim is to design test cases that exercise statements in the code until an acceptable level of coverage is achieved, expressed as a percentage.
- C. In branch testing, the coverage items are control flow transfers between decisions, and the aim is to design test cases to exercise flow transfers in the code until an acceptable level of coverage is achieved. Coverage is measured as the number of branches exercised by the test cases divided by the total number of branches expressed as a percentage.
- D. In branch testing, the coverage items are executable decisions. The aim is to design test cases that exercise statements in the code until an acceptable level of coverage is achieved. Coverage is expressed as a percentage.

Answer: A

Explanation:

Comprehensive and Detailed In-Depth Explanation: Branch testing is a structural testing technique that ensures each branch (decision point) in the control flow is executed at least once. The goal is to measure branch coverage, which is the number of branches exercised divided by the total number of branches.

* (A) describes statement testing, not branch testing.

* (B) and (D) introduce confusion between decisions and statements, whereas branch testing focuses on control flow branches.

In simple terms, branch testing checks that all possible decision outcomes (true/false) are executed, whereas statement testing only ensures that each line of code is executed.

NEW QUESTION # 347

Which ONE of the following options BEST describes a key characteristic of non-functional testing?

- A. Ensuring non-functional testing focuses only on user experience and usability.
- B. Limiting non-functional testing to security testing and performance testing only.
- C. Performing non-functional testing starting at the system test level.
- D. Conducting non-functional testing exclusively at the acceptance test level.

Answer: C

Explanation:

Comprehensive and Detailed In-Depth Explanation:

Non-functional testing evaluates attributes like performance, security, and usability, which are typically assessed at the system test level or higher (A). It is not restricted to acceptance testing (B), goes beyond security and performance testing (C), and covers more than just user experience (D).

Reference: ISTQB CTFL v4.0 Syllabus, Section 2.2.2 - Non-functional Testing

NEW QUESTION # 348

The whole-team approach:

- A. promotes the idea that all team members should have a thorough understanding of test techniques
- B. is mostly adopted in projects aimed at developing safety-critical systems, as it ensures the highest level of testing independence
- C. is a consensus-based approach that engages the whole team in estimating the user stories
- D. promotes the idea that all team members should be responsible for the quality of the product

Answer: D

Explanation:

This answer is correct because the whole-team approach is a way of working in agile projects where all team members share the responsibility for the quality of the product, and collaborate on delivering value to the customer. The whole-team approach involves testers, developers, business analysts, product owners, and other stakeholders in planning, designing, developing, testing, and delivering the product. The whole-team approach fosters communication, feedback, learning, and continuous improvement within the team. NEW QUESTION # 349

Which of the following statements about testware are correct?

I When closing the test activities, all the testware resources can be uninstalled and released II All the testware should be subject to Configuration Management III. The testware, at the end of the project, should be transferred to the organization responsible for maintenance IV The developers are responsible for the correct installation of the testware

- A. I, III
- B. II, IV
- C. I, IV
- **D. II, III**

Answer: D

Explanation:

Testware is a term that refers to all artifacts produced during the testing process, such as test plans, test cases, test scripts, test data, test results, defect reports, etc. The following statements about testware are correct:

* II) All the testware should be subject to Configuration Management. Configuration management is a process that establishes and maintains consistency among work products throughout their life cycle.

Configuration management applies to all testware, as it helps ensure their quality and consistency, track their changes and defects, control their versions and access rights, and link them to other artifacts.

* III) The testware at the end of the project should be transferred to the organization responsible for maintenance. Maintenance testing is testing performed on a software product after delivery to correct defects or improve performance or other attributes.

Maintenance testing requires testware from previous testing activities or phases, such as test cases, test data, test results, etc.

Therefore, the testware at the end of the project should be transferred to the organization responsible for maintenance testing, such as support team or maintenance team. The following statements about testware are incorrect:

* I) When closing the test activities, all the testware resources can be uninstalled and released. This statement is incorrect, as some testware resources may still be needed for future testing activities or phases, such as maintenance testing or regression testing. Therefore, when closing the test activities, some testware resources should be archived and stored for future use, while others can be uninstalled and released.

* IV) The developers are responsible for the correct installation of the testware. This statement is incorrect, as the testers are responsible for the correct installation of the testware. The testers should ensure that they have access to all necessary testware resources and that they are installed and configured properly before starting the test execution.
