Cisco 300-745 시험자료를 찾고 계시나요? ExamPassdump의Cisco 300-745덤프가 고객님의가장 찾고 싶은 자료인 것을 믿어 의심치 않습니다. Cisco 300-745덤프에 있는 문제와 답만 기억하시면 시험을 쉽게 패스하여 자격증을 취득할 수 있습니다. 시험불합격시 덤프비용 환불 가능하기에 시험준비 고민없이 덤프를 빌려쓰는 것이라고 생각하시면 됩니다.

Cisco 300-745 시험요강:

주제	소개
주제 1	<ul style="list-style-type: none"> Applications: Focuses on selecting security solutions to protect applications and designing secure architectures for cloud-native, containerized, and serverless environments using segmentation. Also addresses security design impacts of emerging technologies like AI, ML, and quantum computing.
주제 2	<ul style="list-style-type: none"> Secure Infrastructure: Covers selecting security approaches for endpoints, identities, email, and modern environments like hybrid work, IoT, SaaS, and multi-cloud. Includes choosing VPN tunneling solutions, securing management planes, and selecting the appropriate firewall architecture based on business needs.

주제 3	<ul style="list-style-type: none"> Artificial Intelligence, Automation, and DevSecOps: Explores AI's role in securing network infrastructure, selecting tools for automated security architectures such as SOAR, IaC, and API tooling, and integrating security into DevSecOps workflows and pipelines to minimize deployment risk.
주제 4	<ul style="list-style-type: none"> Risk, Events, and Requirements: Covers SOC incident handling and response tools, modifying security designs to mitigate or respond to incidents, and applying frameworks like MITRE CAPEC, NIST SP 800-37, and SAFE. Includes matching regulatory and compliance requirements to business scenarios.

Cisco인증300-745시험을 패스하기가 어렵다고 하면 합습가이드를 선택하여 간단히 통과하실 수 있습니다. 우리 ExamPassdump에서는 무조건 여러분을 위하여 관련 자료덤프 즉 문제와 답을 만들어낼 것입니다. 우리덤프로Cisco 인증300-745시험준비를 잘하시면 100%Cisco인증300-745시험을 패스할 수 있습니다. ExamPassdump덤프로 여러분은Cisco인증300-745시험을 패스는 물론 여러분의 귀중한 간도 절약하실 수 있습니다.

최신 CCNP Security 300-745 무료샘플문제 (Q46-Q51):

질문 # 46

A software development company uses multiple cloud providers to host applications. The company is designing a scalable firewall solution that must meet the requirements:

- * Consistent security policies across multiple cloud environments.
- * Centralized visibility and management.
- * Scalability to accommodate different cloud platforms.

Which type of firewall meets the requirements?

- A. host-based firewall
- B. traditional firewall
- C. zone-based firewall
- D. distributed firewall

정답: D

설명:

In a multi-cloud architecture, traditional perimeter-based firewalls often create "chokepoints" and fail to provide the granularity needed for east-west traffic between microservices across different providers. A distributed firewall is the architectural solution designed to meet these modern requirements. Unlike a centralized appliance, a distributed firewall is implemented as a software-defined layer that resides close to the workloads—often within the hypervisor or as part of a service mesh.

According to Cisco Security Infrastructure objectives, a distributed firewall allows for centralized management of a unified policy that is pushed out to all enforcement points, regardless of whether the workload is in AWS, Azure, or an on-premises data center. This ensures consistent security policies across the entire footprint. Because the enforcement is decentralized, the solution scales automatically as new cloud platforms or workloads are added. While a Traditional Firewall (Option A) lacks the multi-cloud agility, a Zone-based Firewall (Option B) is typically tied to specific physical or logical interfaces on a router, and a Host-based Firewall (Option D) is managed at the individual OS level, which becomes difficult to coordinate centrally at scale. The distributed firewall model aligns with the Cisco SAFE architectural goal of pervasive security and simplified operations in highly dynamic, heterogeneous cloud environments.

질문 # 47

A manufacturing company experienced a security breach that resulted in sales data being compromised. An engineer participating in the investigation must identify who logged into the sales system during the affected period. Which approach must be used to gather the information?

- A. PKI
- B. SNMP

- C. AAA
- D. NACM

정답: C

설명:

In the aftermath of a security breach, forensic investigators rely on the Accounting portion of AAA (Authentication, Authorization, and Accounting) to reconstruct a timeline of events. While Authentication verifies identity and Authorization defines permissions, Accounting is the specific framework used to track user activity, including login/logout times and the specific commands executed during a session.

According to Cisco Security Infrastructure design objectives, implementing a centralized AAA solution (such as Cisco Identity Services Engine (ISE) or a TACACS+/RADIUS server) is critical for accountability. In this scenario, the engineer would query the AAA logs to identify exactly "who" accessed the sales system during the compromise period. SNMP (Option A) is primarily for network monitoring and performance data, not granular user access logs. NACM (Option B) is an access control model for NETCONF but doesn't provide the broad auditing required here. PKI (Option D) provides the certificates used for digital signatures and encryption but does not log the historical "session" data needed for the investigation. Therefore, AAA is the fundamental architectural requirement for ensuring non-repudiation and providing the audit trail necessary to satisfy risk management and incident response requirements.

질문 # 48

Which financial reporting regulatory framework must a publicly traded company doing business in the US comply with?

- A. HIPAA
- B. SOC
- C. SOX
- D. FEDRAMP

정답: C

설명:

Publicly traded companies in the United States must comply with the Sarbanes-Oxley Act (SOX).

This regulation mandates strict standards for financial reporting, internal controls, and data integrity to protect investors from fraudulent financial practices.

질문 # 49

A technology company has many remote workers who access corporate resources from various locations. The company must ensure that security policies are managed and enforced directly on endpoints, and endpoints are protected from threats regardless of location. Which firewall architecture meets the requirements?

- A. traditional firewall
- B. web application firewall
- C. next-generation firewall
- D. host-based firewall

정답: D

설명:

A host-based firewall enforces security policies directly on endpoints, ensuring they remain protected regardless of location. This architecture provides consistent defense for remote workers accessing corporate resources from outside the traditional network perimeter.

질문 # 50

An oil and gas company recently faced a security breach when an employee's notepad, which contained critical login credentials, was stolen. The incident led to unauthorized access to a user account, which posed a significant risk to sensitive company data and operations. The company wants to adopt a security measure that enhances user account protection. Which action must be taken to prevent breaches like this from happening in the future?

- A. Update the RADIUS server.
- **B. Implement MFA**
- C. Configure a password expiration policy.
- D. Implement single sign-on.

정답: B

설명:

The scenario described-where physical theft of written credentials led to a breach-is a classic failure of single-factor authentication. To mitigate this risk, the company must implement Multi-Factor Authentication (MFA). MFA requires users to provide two or more verification factors to gain access to a resource, typically categorized as something you know (password), something you have (a smartphone or hardware token), or something you are (biometrics).

According to Cisco Security Infrastructure design best practices, MFA (such as Cisco Duo) ensures that even if an attacker possesses valid credentials (the "something you know" from the stolen notepad), they cannot gain access without the second factor (the "something you have"). This effectively neutralizes the threat of stolen passwords. Single Sign-On (SSO) (Option B) improves user experience and centralizes management but does not, by itself, stop an attacker who has the master password. Updating the RADIUS server (Option C) is a maintenance task that doesn't change the authentication logic, and a password expiration policy (Option D) would only limit the "shelf life" of the stolen credentials rather than preventing their initial use. MFA is the most robust architectural control for enhancing identity security and is a core pillar of a Zero Trust framework.

질문 # 51
