

# Three Formats of GetValidTest Google Professional-Cloud-Architect Practice Test Questions

2026 Latest GetValidTest Professional-Cloud-Architect PDF Dumps and Professional-Cloud-Architect Exam Engine Free Share: <https://drive.google.com/open?id=1pHaLgrRiYXWHSYMuYpt0RQPAqTPReGia>

You can download GetValidTest Google Professional-Cloud-Architect PDF dumps file on your desktop computer, laptop, tab, or even on your smartphone. Just download the Professional-Cloud-Architect PDF questions file after paying affordable Prepare for your Google Certified Professional - Cloud Architect (GCP) (Professional-Cloud-Architect) exam questions charges and start Google Certified Professional - Cloud Architect (GCP) (Professional-Cloud-Architect) exam preparation anytime and anywhere.

Google Professional-Cloud-Architect Certification Exam is designed for professionals who want to validate their skills and knowledge in designing and managing solutions on the Google Cloud Platform (GCP). Google Certified Professional - Cloud Architect (GCP) certification is ideal for architects, engineers, and developers who want to demonstrate their expertise in designing and deploying scalable, reliable, and secure cloud solutions. Google Certified Professional - Cloud Architect (GCP) certification exam covers a broad range of topics, including cloud architecture, infrastructure, data management, security, and compliance.

## Exam Details

The Google Professional Cloud Architect certificate requires one qualifying exam. This test is 2 hours long and consists of the multiple-choice and multiple-select questions. The applicants can take it in English or Japanese, but before registering, they are required to pay the fee of \$200. The students can pass the exam online or on-site at one of the testing centers. You should check the certification webpage for more details regarding the registration and testing processes.

## Google Professional-Cloud-Architect Reliable Learning Materials & Professional-Cloud-Architect New Soft Simulations

Three versions for Professional-Cloud-Architect exam cram are available, and you can choose the most suitable one according to your own needs. Professional-Cloud-Architect Online test engine supports all web browsers, and you can also have offline practice. One of the most outstanding features of Professional-Cloud-Architect Online test engine is that it has testing history and performance review, and you can have a general review of what you have learnt through this version. Professional-Cloud-Architect Soft test engine supports MS operating system as well as stimulates real exam environment, therefore it can build up your confidence. Professional-Cloud-Architect PDF version is printable, and you can study anytime.

## Google Certified Professional - Cloud Architect (GCP) Sample Questions (Q146-Q151):

### NEW QUESTION # 146

Your BigQuery project has several users. For audit purposes, you need to see how many queries each user ran in the last month. What should you do?

- A. Connect Google Data Studio to BigQuery. Create a dimension for the users and a metric for the amount of queries per user.
- B. Use Cloud Audit Logging to view Cloud Audit Logs, and create a filter on the query operation to get the required information.
- C. In the BigQuery interface, execute a query on the JOBS table to get the required information.
- D. Use 'bq show' to list all jobs. Per job, use 'bq Is' to list job information and get the required information.

**Answer: C**

Explanation:

Explanation/Reference: <https://cloud.google.com/bigquery/docs/access-control>

#### NEW QUESTION # 147

Your customer wants to do resilience testing of their authentication layer. This consists of a regional managed instance group serving a public REST API that reads from and writes to a Cloud SQL instance. What should you do?

- A. Engage with a security company to run web scrapes that look your users' authentication data on malicious websites and notify you if any is found.
- B. Deploy intrusion detection software to your virtual machines to detect and log unauthorized access.
- C. Schedule a disaster simulation exercise during which you can shut off all VMs in a zone to see how your application behaves.
- D. Configure a red replica for your Cloud SQL instance in a different zone than the master, and then manually trigger a failover while monitoring KPIs for our REST API.

**Answer: C**

Explanation:

<https://cloud.google.com/solutions/scalable-and-resilient-apps>

A well-designed application should scale seamlessly as demand increases and decreases, and be resilient enough to withstand the loss of one or more compute resources.

Resilience: designed to withstand the unexpected

A highly-available, or resilient, application is one that continues to function despite expected or unexpected failures of components in the system. If a single instance fails or an entire zone experiences a problem, a resilient application remains fault tolerant-continuing to function and repairing itself automatically if necessary. Because stateful information isn't stored on any single instance, the loss of an instance-or even an entire zone-should not impact the application's performance.

#### NEW QUESTION # 148

You have a Python web application with many dependencies that requires 0.1 CPU cores and 128 MB of memory to operate in production. You want to monitor and maximize machine utilization. You also to reliably deploy new versions of the application. Which set of steps should you take?

- A. Perform the following:
  1. Create a Kubernetes Engine cluster with n1-standard-1 type machines.
  2. Build a Docker image from the production branch with all of the dependencies, and tag it with the version number.
  3. Create a Kubernetes Deployment with the imagePullPolicy set to "IfNotPresent" in the staging namespace, and then promote it to the production namespace after testing.
- B. Perform the following:
  1. Create a Kubernetes Engine cluster with n1-standard-4 type machines.
  2. Build a Docker image from the master branch with all of the dependencies, and tag it with "latest".
  3. Create a Kubernetes Deployment in the default namespace with the imagePullPolicy set to "Always".

Restart the pods to automatically deploy new production releases.
- C. Perform the following:
  1. Create a managed instance group with n1-standard-1 type machines.
  2. Build a Compute Engine image from the production branch that contains all of the dependencies and automatically starts the Python app.
  3. Rebuild the Compute Engine image, and update the instance template to deploy new production releases.
- D. Perform the following:
  1. Create a managed instance group with f1-micro type machines.
  2. Use a startup script to clone the repository, check out the production branch, install the dependencies, and start the Python

app.

3. Restart the instances to automatically deploy new production releases.

**Answer: A**

#### NEW QUESTION # 149

Your company has just recently activated Cloud Identity to manage users. The Google Cloud Organization has been configured as well. The security team needs to secure projects that will be part of the Organization. They want to prohibit IAM users outside the domain from gaining permissions from now on. What should they do?

- A. Create a technical user (e.g., crawler@yourdomain.com), and give it the project owner role at root organization level. Write a bash script that:
  - \* Lists all the IAM rules of all projects within the organization.
  - \* Deletes all users that do not belong to the company domain.Create a Compute Engine instance in a project within the Organization and configure gcloud to be executed with technical user credentials. Configure a cron job that executes the bash script every hour.
- B. Configure an organization policy to block creation of service accounts.
- **C. Configure an organization policy to restrict identities by domain.**
- D. Configure Cloud Scheduler to trigger a Cloud Function every hour that removes all users that don't belong to the Cloud Identity domain from all projects.

**Answer: C**

Explanation:

<https://cloud.google.com/resource-manager/docs/organization-policy/restricting-domains>

#### NEW QUESTION # 150

Your web application uses Google Kubernetes Engine to manage several workloads. One workload requires a consistent set of hostnames even after pod scaling and relaunches.

Which feature of Kubernetes should you use to accomplish this?

- A. Role-based access control
- B. Persistent Volumes
- **C. StatefulSets**
- D. Container environment variables

**Answer: C**

Explanation:
