100% Pass Quiz Sitecore-XM-Cloud-Developer - Pass-Sure Sitecore XM Cloud Developer Certification Exam Certification

Being respected and gaining a high social status maybe what you always long for. But if you want to achieve that you must own good abilities and profound knowledge in some certain area. You only need 20-30 hours to learn and prepare for the exam, because it is enough for you to grasp all content of our study materials, and the passing rate is very high and about 98%-100%. Our laTest Sitecore-XM-Cloud-Developer Quiz torrent provides 3 versions and you can choose the most suitable one for you to learn. All in all, there are many merits of our Sitecore-XM-Cloud-Developer quiz prep.

Sitecore XM Cloud Developer Certification Exam Sample Questions (Q12-Q17):

NEW QUESTION # 12

How can a developer differentiate between XM Cloud Components and Headless SXA Components?

- A. XM Cloud Components offer drag-and-drop construction of pages. Headless SXA Components require manual coding and can only be added to a page by a developer.
- B. In XM Cloud Components, the Styles library ensures visual consistency across components. Headless SXA Components emphasize dynamic content mapping.
- C. XM Cloud Components are a low/no code builder for creating components that can consume data from multiple data sources. Headless SXA components require code that consumes data from the same data sources.
- D. XM Cloud Components provide responsive designs for different device types. Headless SXA Components are exclusively focused on static layouts.

Answer: C

Explanation:

XM Cloud Components provide a low-code or no-code solution for building components, allowing for the consumption of data from various sources without extensive coding. On the other hand, Headless SXA Components are designed for developers to code and consume data, typically from the same data sources, offering a more hands-on approach to component creation.

References: The distinction between XM Cloud Components and Headless SXA Components is outlined in the Sitecore XM Cloud documentation, which describes the capabilities and intended use cases for each type of component¹².

NEW QUESTION # 13

A developer wants to add a new language to a headless SXA site. Which steps are required to add a new language in XM Cloud?

- A. Add language in /sitecore/system/languages. Then, on the content item, change the language dropdown to the new language and add a new version.
- B. Install a language pack on the Content Management instance and then add the language in /sitecore/system/languages.
- C. Add language in /sitecore/system/languages, right click the site root, and go to scripts -> Add Site language.
- D. They must enter the country code in the Language field. Then, on the content item, change the language dropdown to the new language and add a new version.

Answer: C

NEW QUESTION # 14

A build to XM Cloud fails. Which options are available for a developer to diagnose the error?

- A. The deployment log files for the environment
- **B. The project details page in the Deploy app**
- C. The Deploy app system status page
- D. The Content Management instance logs for the environment

Answer: B

Explanation:

When a build fails in XM Cloud, developers need to diagnose the issue by checking relevant logs and system information. The best place to start is the Project Details Page in the Deploy App, which provides insights into deployment failures, error messages, and related logs.

* The Project Details Page in the XM Cloud Deploy app shows the deployment history, including build failures.

* It provides detailed error messages and links to deployment logs.

* Developers can view logs and troubleshoot issues directly within the Deploy App.

Why is Option C Correct?

* Option A - The Deploy app system status page#Incorrect because this page only shows the overall status of XM Cloud services (whether the system is operational or experiencing outages). It does not provide detailed logs for a specific failed build.

* Option B - The Content Management instance logs for the environment#Incorrect because these logs track runtime errors related to the CMS and API calls but do not provide direct build or deployment failure details.

* Option D - The deployment log files for the environment#Incorrect because deployment logs are accessed through the Deploy app's project details page. There are no separate "deployment log files" that can be accessed directly in XM Cloud.

Why Other Options Are Incorrect? Thus, the correct answer is #C. The project details page in the Deploy app.

* XM Cloud Deploy App Overview: <https://doc.sitecore.com/xmc/en/developers/xm-cloud/xm-cloud-deploy.html>

* Troubleshooting Deployments in XM Cloud: <https://doc.sitecore.com/xmc/en/developers/xm-cloud/deployment-troubleshooting.html>

* Sitecore XM Cloud System Status Page: <https://status.sitecorecloud.io/> References for XM Cloud Development:

NEW QUESTION # 15

Why should a developer assign security to roles instead of users when setting up security on a site?

- A. Security roles can assign individual rights and permissions to be configured by users.
- B. Individual users with a role can set and configure their own item security permissions.
- C. Role-based security allows multiple users to have the same username.
- **D. Security can be managed more efficiently as the rights and permissions apply to a group of users.**

Answer: D

Explanation:

According to the Sitecore XM Cloud Documentation for Developers¹, security roles define how different users access different types of records in Sitecore. To control access to data and resources, you can create or modify security roles and change the security roles that are assigned to your users. A user can have multiple security roles. Security role privileges are cumulative. Users are granted the privileges that are available in each role that's assigned to them².

This makes it easier for you to manage your security system because you do not necessarily have to assign access rights for each item in your content tree. Instead, you only need to assign and manage the access rights on the parent items and then specify whether their descendants can inherit these access rights³.

NEW QUESTION # 16

Which of the following needs to happen for a developer to be able to log in into the XM Cloud Deploy app?

- **A. An Organization Admin or Organization Owner must update their role in the Sitecore Cloud Portal.**
- B. An Organization Admin or Organization Owner must update their role using the XM Cloud Deploy app.
- C. Only the Organization Owner can update their role using the XM Cloud Deploy app.
- D. Only the Organization Owner can update their role in the Sitecore Cloud Portal.

Answer: A

Explanation:

In Sitecore XM Cloud, access to the XM Cloud Deploy app is managed through the Sitecore Cloud Portal.

To allow a developer to log in, their user role must be updated to include the necessary permissions.

- * The Sitecore Cloud Portal is the central place where user roles and permissions are managed.
 - * Only users with the correct role assignments can access the XM Cloud Deploy app.
 - * Both an Organization Admin and an Organization Owner have the ability to update a user's role to grant them access.
 - * (B) Only the Organization Owner can update their role in the Sitecore Cloud Portal # Incorrect
 - * The Organization Admin also has permission to manage users and update roles.
 - * It is not restricted to just the Organization Owner.
 - * (C) Only the Organization Owner can update their role using the XM Cloud Deploy app # Incorrect
 - * User role management cannot be done from the XM Cloud Deploy app.
 - * All role updates must be made in the Sitecore Cloud Portal.
 - * (D) An Organization Admin or Organization Owner must update their role using the XM Cloud Deploy app # Incorrect
 - * The XM Cloud Deploy app does not handle user management.
 - * Roles must be managed through the Sitecore Cloud Portal, not through XM Cloud Deploy.
- # Correct answer: A (An Organization Admin or Organization Owner must update their role in the Sitecore Cloud Portal) # Why Other Options Are Incorrect:
- * Log in to the Sitecore Cloud Portal (<https://portal.sitecorecloud.io>).
 - * Go to "User Management."
 - * Find the developer's user account.
 - * Assign the appropriate role (e.g., "Deployment User" or another suitable role).
 - * Save changes- the developer should now be able to access the XM Cloud Deploy app.
- Steps to Grant Access to the XM Cloud Deploy App
- * Sitecore Cloud Portal Documentation- Managing Users and Roles
 - * Sitecore XM Cloud Deployment Guide- Working with XM Cloud Deploy
 - * Security Best Practices in Sitecore XM Cloud- User Access Control
