Snowflake Certified SnowPro Associate - Platform Certification Sample Questions (Q163-Q168):

NEW QUESTION # 163

You are using Snowsight to analyze query performance. You notice a query that frequently accesses a table 'orders' is slow. Which of the following Snowsight features and actions could you use to identify potential bottlenecks and improve query performance? Select all that apply.

- A. Review the SQL text formatting in the query history to ensure it follows Snowflake's best practices.
- B. Examine the query profile in Snowsight to identify stages with high execution time and resource consumption.
- C. Disable query history in Snowsight to reduce the overhead on the system.
- D. Use the 'Advisor' feature in Snowsight to receive recommendations on potential performance improvements, such as creating indexes or optimizing table clustering.
- E. Use Snowsight's data lineage feature to trace the origin of the 'orders' table and identify any upstream transformations that might be causing performance issues.

Answer: B,D

Explanation:

The query profile in Snowsight provides detailed information about each stage of a query's execution, allowing you to identify bottlenecks. The 'Advisor' feature offers recommendations for performance improvements. Data lineage (Option B) might be helpful in some cases, but it's not the most direct way to address query performance. Disabling query history (Option C) is counterproductive for performance analysis. Option E has no direct impact on query performance. Only relevant functions in Snowsight related to Snowflake are acceptable.

NEW QUESTION # 164

What is the primary benefit of the Snowflake data cloud?

- A. It eliminates the need for data governance.
- B. It enables organizations to unite and share their data.
- C. It provides direct access to underlying infrastructure.
- D. It replaces traditional data warehouses with on-premises solutions.

Answer: B

Explanation:

The Snowflake Data Cloud allows organizations to seamlessly share, access, and collaborate on data across departments and external partners, without copying or moving data. Through secure data sharing, listings, and data clean rooms, Snowflake eliminates data silos and dramatically improves data collaboration.

It does not eliminate the need for governance-Snowflake enhances governance via RBAC, masking policies, and centralized controls. It does not provide access to underlying cloud infrastructure; Snowflake abstracts that. It is not an on-premises solution; Snowflake is fully cloud-native.

Thus, the primary benefit is unifying and securely sharing data across the ecosystem.

NEW QUESTION # 165

What information can be obtained by describing a table in Snowflake? (Choose any 3 options)

- A. Table Origin
- B. Indexes and keys
- C. Column names and data types
- D. Table constraints

Answer: B,C,D

Explanation:

The DESCRIBE TABLE (or DESC TABLE) command in Snowflake provides core metadata about table structure. This includes column names, data types, nullability, and default values. It also returns constraints if applied, such as PRIMARY KEY, UNIQUE, and CHECK constraints. Snowflake additionally displays information regarding clustering keys and other table characteristics. The command does not show table origin; Snowflake does not track lineage information directly through DESCRIBE TABLE. Indexes in Snowflake are not traditional B-tree indexes-Snowflake uses micro-partition pruning instead-but DESCRIBE TABLE can show clustering keys, which function similarly by enabling optimized data skipping. Therefore, column definitions, constraints, and keys are all valid outputs of DESCRIBE TABLE.

NEW QUESTION # 166

A Snowflake data provider wishes to share a database 'PRODUCTS DB' with a consumer account using a private data share. The provider wants to ensure the consumer can only query objects in 'PRODUCTS DB' but cannot create new objects within the shared database. The data provider executes the following commands:

- A.
- B.
- C.
- D.
- E.

Answer: A

Explanation:

The 'GRANT IMPORTED PRIVILEGES' command is the correct way to grant read-only access to the consumer. 'USAGE is a prerequisite for 'SELECT', but doesn't by itself grant object access. Ownership is explicitly not desired as it grants full control. Option E is also not needed as it grants access to future tables and views. Option D focuses only on the public schema.

NEW QUESTION # 167

You are developing a data pipeline in Snowflake Notebooks. One cell contains Python code that uses the Snowpark DataFrame API to perform several data transformations. After executing the cell, you observe that the execution status is 'Canceled'. What are the possible causes for this status, and how can you diagnose the issue?

- A. An error occurred during the Snowpark DataFrame operations, triggering an automatic cancellation by the Snowflake engine.
- B. The Snowflake warehouse was suspended due to inactivity, interrupting the Snowpark DataFrame operations.
- C. A Snowflake administrator terminated the query associated with the Snowpark session.
- D. The user manually canceled the cell execution using the Notebook interface.
- E. The Notebook environment encountered a memory error due to the size of the Snowpark DataFrame, leading to a cancellation.

Answer: B,C,D

Explanation:

A 'Canceled' status indicates an intentional or forced termination. Manual cancellation (A) is the most straightforward cause. Warehouse suspension (B) will interrupt execution. A Snowflake admin can terminate queries (E). Error in Snowpark DataFrame execution (C) typically results in a failed status with an error message. Memory errors (D) could lead to a failure, but cancellation is less likely unless explicitly triggered within the code.
