Quiz Latest AP-202 - B2B Commerce for Developers Accredited Professional Valid Practice Materials

According to the needs of all people, the experts and professors in our company designed three different versions of the AP-202 certification training materials for all customers. The three versions are very flexible for all customers to operate. You can choose the version for yourself which is most suitable, and all the AP-202 Training Materials of our company can be found in the three versions. It is very flexible for you to use the three versions of the AP-202 latest questions to preparing for your AP-202 exam.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q182-Q187):

NEW QUESTION # 182

How should a developer get the grand total amount, including shipping and tax, for items in the cart and in the currency of the cart, when developing a new Lightning web component for an Aura storefront cart page?

- A. {ICart.Details.Fields.grandTotal}
- B. {ICart.Totals.grand Total}
- C. {!Cart.Details.grandTotal}
- D. {!Cart.Fields.grandTotal}

Answer: A

Explanation:

According to the B2B Commerce Developer Guide, the ICart interface provides access to the cart object and its related data. The Details property of the ICart interface returns an ICartDetails object, which contains information about the cart such as the currency, the subtotal, the shipping cost, the tax, and the grand total. The Fields property of the ICartDetails interface returns a map of field names and values for the cart object. Therefore, to get the grand total amount for items in the cart and in the currency of the cart, a

developer should use the expression {ICart.Details.Fields.grandTotal}, which returns the value of the grandTotal field from the cart object.[B2B Commerce Developer Guide](#),[ICart Interface](#),[ICartDetails Interface](#)

NEW QUESTION # 183

Which tool should a developer use to author automated tests for custom Lightning web components?

- A. Jest
- B. Salesforce Developer Console
- C. Visual Studio Code
- D. Salesforce CLI

Answer: A

Explanation:

A developer should use Jest to author automated tests for custom Lightning web components. Jest is a powerful tool with rich features for writing JavaScript tests. It is the recommended testing framework for Lightning web components by Salesforce¹. Jest allows the developer to write unit tests in local JavaScript files, run them from the command line or Visual Studio Code, and debug them using breakpoints and watch expressions². Jest also provides features such as mocking, code coverage, snapshots, and asynchronous testing³.

Option A, Option B, and Option D are incorrect because they are not testing tools, but rather development tools. Visual Studio Code is an integrated development environment (IDE) that supports Lightning web components development with extensions and plugins⁴. Salesforce CLI is a command line interface that allows the developer to create, deploy, and manage Lightning web components projects⁵. Salesforce Developer Console is a web-based tool that provides code editing, debugging, and testing features for Apex and Visualforce, but not for Lightning web components. Reference:

NEW QUESTION # 184

Which template will correctly display the details message only when areDetailsVisible becomes true given the following code in a Lightning Web Component?

- A.
- B.
- C.
- D.

Answer: D

Explanation:

The template that will correctly display the details message only when areDetailsVisible becomes true given the following code in a Lightning Web Component is option C. Option C uses the iftrue directive to conditionally render a template block based on the value of areDetailsVisible. If areDetailsVisible is true, the template block inside the <template iftrue={areDetailsVisible}> tag will be rendered. Otherwise, it will be skipped. Option A is incorrect because it uses the ifffalse directive, which does the opposite of iftrue. It renders the template block only when areDetailsVisible is false. Option B is incorrect because it uses an invalid syntax for the if directive. The if directive requires a colon (:) after the if keyword, not an equal sign (=). Option D is incorrect because it uses an invalid syntax for the template tag. The template tag requires a closing tag (</template>), not a self-closing tag (<template/>).

NEW QUESTION # 185

Which orders can a user view on Order List Component (Aura) for B2B stores?

- A. Orders placed in the current storefront and related to the current effective account

- B. Orders placed in any storefront and related to the current effective account
- C. Orders placed in the current storefront and related to the current user's account
- D. Orders placed in any storefront and related to the current user's account

Answer: A

Explanation:

According to the B2B Commerce Developer Guide, the Order List Component (Aura) for B2B stores displays a list of orders that the user can view and reorder. The component filters the orders based on the current storefront and the current effective account. The current effective account is the account that the user is currently acting on behalf of, which can be different from the user's own account. The component does not show orders placed in other storefronts or related to other accounts, even if the user has access to them. Therefore, the correct answer is A. Orders placed in the current storefront and related to the current effective account. The other options are incorrect because they do not match the criteria of the component. NEW QUESTION # 186

What tool can a developer use to investigate errors during development?

- A. Support cases
- **B. Browser dev tools**
- C. Commerce Diagnostics Event Logging
- D. Checkout Flow Log

Answer: B

Explanation:

Browser dev tools are a set of web authoring and debugging tools built into most modern browsers. They allow developers to inspect, edit, and debug the HTML, CSS, JavaScript, and network activity of a web page. They can also provide useful information about errors, warnings, performance, and accessibility issues. Browser dev tools are especially helpful for developing and testing Lightning web components, as they can display the component hierarchy, attributes, events, and slots.

The other options are not correct because:

A) Commerce Diagnostics Event Logging is a feature that enables developers to capture and analyze events that occur during the execution of B2C Commerce code. It can help identify performance bottlenecks, memory leaks, and unexpected behavior.

However, it is not a tool that can be used directly by the developer, but rather a service that requires a support request to enable and access.

B) Checkout Flow Log is a log file that shows the details of the checkout flow execution, such as the input and output parameters, the pipeline steps, and the errors and warnings. It can help troubleshoot issues related to the checkout process, such as payment, shipping, or tax calculation. However, it is not a tool that can be used during development, but rather a log file that can be accessed after the checkout flow has run.

C) Support cases are requests for assistance from the Salesforce support team. They can help resolve technical issues, provide guidance, or escalate bugs. However, they are not a tool that can be used to investigate errors during development, but rather a communication channel that can be used after the developer has exhausted other resources.
