```
cluster1::*> cluster ping-cluster node1

Host is node2
Getting addresses from network interface table...

Larger than PMTU communication succeeds on 4 path(s)
RPC status:
2 paths up, 0 paths down (tcp check)
2 paths up, 0 paths down (udp check)
```

Which two checks indicate that the cluster is ready for the replacement to be performed? (Choose two.)

- A. 2 paths up, 0 paths down (UDP check)
- B. basic connectivity succeeds on 4 path(s)
- C. larger than PMTU communication succeeds on 4 path(s)
- D. 2 paths up, 0 paths down (TCP check)

Answer: A,D

Explanation:

For safe cluster switch replacement, ONTAP requires verification that both TCP and UDP connectivity are fully redundant and operational. The output confirms no paths are down, which validates resilience.

#### NEW QUESTION # 68

cluster1-04	crs	26	26	1	cluster1-02	secondary

Referring to the exhibit, which two statements are correct? (Choose two.)

- A. Remove the node, then the cluster will elect a new master to remain in quorum.
- B. Make the node ineligible by using the cluster modify -eligibility false command, then remove the node.
- C. Verify that high availability is configured for failover to the HA partner, then remove the node.
- D. Move Epsilon to cluster1-02, then remove the node.

Answer: B,C

Explanation:

Before removing a node from an ONTAP cluster, NetApp installation procedures require several validation steps to ensure cluster quorum and availability are preserved. The exhibit shows cluster ring information indicating quorum status and master node assignment.

First, high availability must be confirmed. The node being removed must have an HA partner capable of taking over resources. This ensures nondisruptive operation during and after node removal, which is a mandatory prerequisite for the cluster remove-node command.

Second, the node must be marked as ineligible using the cluster modify -eligibility false command. This prevents ONTAP from attempting to assign cluster responsibilities or data ownership to the node while it is being removed. This step is explicitly required in NetApp removal workflows.

Moving Epsilon (the quorum tie-breaker) to the node being removed would be incorrect and dangerous, as Epsilon must remain on a stable node to maintain cluster quorum. Additionally, the cluster does not automatically re-elect a new master simply because a node is removed; mastership is determined before removal.

Therefore, the correct statements are A and B.

### NEW QUESTION # 69

After adding two nodes to an FC-enabled cluster, the storage administrator wants to ensure that existing LUNs can use paths on the new nodes.

What is required to complete this task?

- A. Use the `lun mapping add-reporting-nodes` command.
- B. Rescan the bus on the hosts by using the `rescan-scsi-bus.sh` script.
- C. Use the storage port rescan command.
- D. Use the `lun bind create` command.

**Answer: A**

### NEW QUESTION # 70

During installation, you need to configure time synchronization across all nodes. Which two configurations ensure consistent time settings and prevent authentication or logging issues?

- A. Configure SnapMirror relationships
- B. Configure NTP servers
- C. Set correct time zone
- D. Create aggregates

**Answer: B,C**

Explanation:

NTP ensures accurate time synchronization, while correct time zone settings maintain consistency across logs and services. Aggregates and SnapMirror do not affect system time configuration.
