A Mule implementation uses a HTTP Request within an Unit Successful scope to connect to an API.

How should a permanent error response like HTTP:UNAUTHORIZED be handle inside Until Successful to reduce latency?

- A. Configure retrying until a MULERETRY\_EXHAUSTED error is raised or the API responds back with a successful response.
- **B. Put the HTTP Request inside a try scope in Unit Successful.**  
**In the error handler, use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED.**
- C. In Until Successful configuration, set the retry count to 1 for error type HTTP: UNAUTHORIZED.
- D. Put the HTTP Request inside a try scope in Unit Successful.  
In the error handler, use On Error Propagate to catch permanent errors like HTTP UNAUTHORIZED.

**Answer: B**

Explanation:

To handle a permanent error response like HTTP:UNAUTHORIZED inside Until Successful, the developer should put the HTTP Request inside a try scope in Unit Successful, and use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED in the error handler. This way, the developer can avoid retrying requests that will always fail due to a permanent error, and reduce latency. On Error Continue allows the flow to continue processing after handling the error. Reference:

- A. Keytool-importkeystore -srckeystore keystore.p12-srcstoretype PKCS12 -destkeystore keystore.jks -deststoretype JKS
- B. Keytool-importkeystore -srckeystore keystore.jks-srcstoretype JKS -destkeystore keystore.p12 -deststoretype PKCS12

#### NEW QUESTION # 39

Two APIs are deployed to a two-node on-prem cluster. Due to a requirements change, the two APIs must communicate to exchange data asynchronously.

- **A. If the two APIs use the same domain, the VM Connector can be leveraged**
- B. It is not possible to use the VM Connector since the APIs are running in a cluster mode and each mode has it own set of VM Queues
- C. The VM Connector is used to inter-application communication, so it is not possible to use the VM Connector
- D. Instead of using the VM Connector use <flow-ref>directly

**Answer: A**

Explanation:

To communicate asynchronously between two APIs deployed to a two-node on-prem cluster, the developer can use the VM Connector if the two APIs use the same domain. The VM Connector allows passing messages between different Mule applications within a single Mule runtime instance or across different instances using shared memory or persistent storage. If two APIs are deployed under the same domain, they can share resources such as VM queues and communicate asynchronously using VM

Connector operations. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/vm-connector> <https://docs.mulesoft.com/mule-runtime/4.3/shared-resources>

- A. Use "Set Event to pass the input that is needed, and keep the test cases for Flow-1 and Flow-2 independent"
- B. Use 'After Test Case' to produce the data needed from Flow-1 test cases to pass to Flow-2 test cases
- C. Chain together the test suites and test cases for Flow-1 and Flow-2
- D. Use "Before Test Case" To collect data from Flow-1 test cases before running Flow-2 test cases

**Answer: A**

Explanation:

To ensure the test suites and test cases written for Flow-1 and Flow-2 will execute successfully, the developer should use a Set Event processor to pass the input that is needed by Flow-2, and keep the test cases for Flow-1 and Flow-2 independent. This way, the developer can isolate the testing of each flow and avoid coupling them together. Reference: <https://docs.mulesoft.com/munit/2.3/munit-test-flow>
