CompTIA Cloud Essentials+ Certification Exam Sample Questions (Q486-Q491):

NEW QUESTION # 486

A systems administrator is reviewing a disaster recovery option that requires little to no downtime in the event of a natural disaster.

Which of the following BEST meets this requirement?

- A. Configure auto-scaling.
- B. Configure geo-redundancy.
- C. Configure availability zones.
- D. Configure high availability.

Answer: C

NEW QUESTION # 487

Which of the following is a relevant component of the cloud ecosystem?

- A. Image factory
- B. Security procedures
- C. Trained IT staff
- D. Hypervisors

Answer: A

NEW QUESTION # 488

A software developer wants to ensure a packaged application can be deployed in different environments without modifying anything but the application settings. The developer creates an image and provides instructions for the systems administrator to use for deployment. This is an example of:

- A. deployment automation.
- B. source code control.
- C. containerization.
- D. application versioning.

Answer: C

Explanation:

Containerization is the process of developing software applications for containers, which are isolated user spaces that bundle application code with all the dependencies and libraries required to run on any infrastructure. Containerization allows applications to be deployed in different environments without modifying anything but the application settings. This is different from application versioning, which is the practice of assigning unique identifiers to different versions of an application. Source code control is the management of changes to source code files, which is not related to deployment. Deployment automation is the use of tools and scripts to automate the deployment process, which may or may not involve containers. NEW QUESTION # 489

Which of the following is the cloud storage technology that would allow a company with 12 nearly identical servers to have the SMALLEST storage footprint?

- A. Deduplication

- B. Compression
- C. Software-defined storage
- D. Capacity on demand

Answer: A

Explanation:

SAN policies can be set to compress data written to the RAID array using techniques such as data deduplication, which reduces duplicate data blocks to single occurrences.

Deduplication removes duplicate disk blocks and replaces duplicates with pointers to reduce disk space consumption.

NEW QUESTION # 490

A business analyst is drafting a proposal for eliminating redundant copies of data from a SAN disk drive. Which of the following terms should the analyst mention in the proposal?

- A. Sanitization
- B. Encryption
- C. Deduplication
- D. Compression

Answer: C

Explanation:

Deduplication is a technique that eliminates redundant copies of data from a storage device, such as a SAN disk drive.

Deduplication can reduce the amount of storage space required and improve the performance and efficiency of the storage system. Deduplication works by identifying and removing duplicate blocks of data within or across files, and replacing them with pointers to a single copy of the data. Deduplication can be performed at the file level or the block level, depending on the granularity and the algorithm used. Deduplication is often used in backup and archive scenarios, where data is highly redundant and can be deduplicated across multiple backups. Deduplication can also be used in primary storage scenarios, such as SAN disk drives, especially for all-flash arrays that implement deduplication techniques. Deduplication is different from compression, which is another technique that reduces the size of data by removing redundant information within a data block. Deduplication and compression can work together to achieve higher storage savings. Deduplication is also different from encryption, which is a technique that protects the confidentiality and integrity of data by transforming it into an unreadable form using a secret key. Deduplication is not effective for encrypted data, as encryption makes the data appear random and unique. Deduplication is also different from sanitization, which is a technique that permanently erases data from a storage device, making it unrecoverable. Deduplication does not erase data, but rather consolidates it and removes duplicates. Therefore, the correct term for eliminating redundant copies of data from a SAN disk drive is deduplication.
