問題 #69

Universal Hiring uses Salesforce to capture job applications. A salesforce administrator created two custom objects; Job__c acting as the master object, Job_Application__c acting as the detail.

Within the Job__c object, a custom multi-select picklist, Preferred Locations__c, contains a list of approved states for the position. Each Job_Application__c record relates to a Contact within the system through a master-detail relationship.

Recruiters have requested the ability to view whether the Contact's Mailing State value matches a value selected on the Preferred_Locations__c field, within the Job_Application__c record. Recruiters would like this value to be kept in sync if changes occur to the Contact's Mailing State.

What is the recommended tool a developer should use to meet the business requirement?

- A. Record-triggered flow
- B. Roll-up summary field
- **C. Formula field**
- D. Apex trigger

答案: C

解題說明:

Scenario:

Objects Involved:

Job__c (Master)

Job_Application__c (Detail)

Contact (Related via Master-Detail relationship on Job_Application__c)

Fields:

Preferred_Locations__c (Multi-select picklist on Job__c)

MailingState (Field on Contact)

Requirement:

On Job_Application__c, display whether the Contact's MailingState matches any value in Preferred_Locations__c on the related Job__c.

Keep this value in sync if changes occur to the Contact's MailingState.

Solution:

Option C: Formula field

Correct Approach.

Create a Formula Field on Job_Application__c that compares the Contact's MailingState with the Job's Preferred_Locations__c. Since Job_Application__c is a detail of Job__c and has a lookup to Contact, the formula can reference fields from both related objects.

Use the INCLUDES() function to check if the MailingState is among the selected values in Preferred_Locations__c.

Sample Formula:

```
INCLUDES(Job__r.Preferred_Locations__c, Contact__r.MailingState)
```

This formula returns a Boolean (TRUE or FALSE) indicating whether there's a match.

Benefits:

Real-Time Calculation: Updates automatically when either field changes.

No Code Required: Declarative solution using formula fields.

Maintenance: Easy to manage and update if needed.

Roll-up Summary Fields are used to perform calculations on detail records and summarize them on the master record.

Cannot be used to compare fields between unrelated objects or for the given comparison.

Option B: Record-triggered flow

Possible but Not Optimal.

A flow could be used to update a field based on changes.

However, it adds complexity and requires maintenance.

Flows consume resources and may have performance considerations.

Option D: Apex trigger

Possible but Overkill.

An Apex trigger can handle the requirement but introduces code maintenance.

Not necessary when a declarative solution exists.

Conclusion:

A Formula Field is the recommended tool to meet the business requirement.

It provides a simple, efficient, and maintainable solution that updates in real-time when data changes.

Reference:

Using Cross-Object Formulas

INCLUDES Function

Why Other Options are Not Suitable:

Option A: Roll-up summary field

Incorrect Use Case.

問題 #70

A developer created this Apex trigger that calls MyClass.myStaticMethod:

```
trigger myTrigger on Contact (before insert)
{
    MyClass.myStaticMethod(trigger.new);
}
```

The developer creates a test class with a test method that calls MyClass.myStaticMethod directly, resulting in 81% overall code coverage. What happens when the developer tries to deploy the trigger and two classes to production, assuming no other code exists?

- A. The deployment passes because both classes and the trigger were included in the deployment.
- B. The deployment fails because no assertions were made in the test method.
- C. The deployment passes because the Apex code has the required >75% code coverage.
- **D. The deployment fails because the Apex trigger has no code coverage.**

答案: D

問題 #71

An org has an existing flow that edits an Opportunity with an Update Records element. A developer must update the flow to also create a Contact and store the created Contact's ID on the Opportunity.

Which update must the developer make in the flow?

- **A. Add a new Create Records element.**
- B. Add a new Update Records element.
- C. Add a new Get Records element.
- D. Add a new Roll Back Records element.

答案: A

解題說明:

* Why Create Records Element?

* The Create Record element adds the functionality to create a Contact record.

* The Contact's ID can then be stored on the Opportunity using a variable or field update.

* Why Not Other Options?

* A: Update Records is for updating existing records, not creating new ones.

* B: Roll Back Records is used for rolling back transactions, not for creating records.

* D: Get Records retrieves records but does not create them.

問題 #72

Universal Containers wants to assess the advantages of declarative development versus programmatic customization for specific use cases in its Salesforce implementation.

What are two characteristics of declarative development over programmatic customization? Choose 2 answers

- **A. Declarative development can be done using the setup menu.**
- **B. Declarative development does not require Apex test classes.**

- C. Declarative development has higher design limits and query limits.
- D. Declarative code logic does not require maintenance or review.

答案: A,B

問題 #73

What are two considerations for running a flow in debug mode? Choose 2 answers

- A. Input variables of type record cannot be passed into the flow.
- B. Callouts to external systems are not executed when debugging a flow.
- C. DML operations will be rolled back when the debugging ends.
- D. Clicking Pause or executing a Pause element closes the flow and ends debugging.

答案: A,D
