ハイパスレートJN0-253資格参考書 & 資格試験におけるリーダーオファー & 信頼できるJN0-253復習時間

Fast2testすべての賞賛と高い価値は、JN0-253練習エンジンのより高い標準へと導きます。そのため、試験の受験者の関心を高く評価するあなたの関心に対して、私たちの労働倫理が強く強調されています。私たちJuniperの実践教材は、Mist AI, Associate (JNCIA-MistAI)専門知識の本質を捉えて、あなたを楽に望ましい結果に導きます。そこで、JN0-253学習教材の利点を引き続き参照しましょう。

Juniper Mist AI, Associate (JNCIA-MistAI) 認定 JN0-253 試験問題 (Q54-Q59):

質問 # 54

Your company hosts its own enterprise-wide monitoring solution. You want to receive events from Juniper Mist. How would you accomplish this task?

- A. Sending an e-mail
- B. Using the API
- C. Using a WebSocket
- **D. Using a webhook**

正解: D

解説:

In the Juniper Mist Cloud, webhooks are used to send real-time event notifications from Mist Cloud to external systems such as third-party monitoring or automation platforms. This integration mechanism allows administrators to collect alerts, status changes, and

analytics data directly from Mist Cloud without the need for constant API polling.

According to the Juniper Mist API and Webhook Integration Guide, webhooks are defined as:

"A push-based communication method that enables Juniper Mist Cloud to send event data to a customer-defined HTTP endpoint when specific network events occur." This capability allows seamless integration with enterprise monitoring solutions such as ServiceNow, Splunk, or Datadog, enabling organizations to centralize event management.

The other options are not suitable:

* A (API): APIs are pull-based and require polling for updates, not push notifications.

* B (Email): Not supported for automated system-to-system event delivery.

* D (WebSocket): Used for live telemetry and streaming data (e.g., client updates), not event alerts.

Therefore, the correct method is C. Using a webhook.

質問 # 55

When viewing the LATEST UPDATES on the Marvis Actions page, you see an action labeled AI VALIDATED. What does this status mean?

- A. The issue is resolved but was not manually marked resolved.
- **B. The issue was identified and resolved entirely by Marvis.**
- C. The issue is unresolved.
- D. The issue was marked resolved by an administrator.

正解: B

解説:

In the Juniper Mist Marvis Actions dashboard, issues and recommendations are displayed with status labels indicating their progress and resolution method. One of these statuses is AI VALIDATED, which signifies that the issue was automatically detected, diagnosed, and resolved by Marvis AI without requiring manual intervention.

According to the Juniper Mist Marvis Virtual Network Assistant Operations Guide:

"AI VALIDATED indicates that Marvis has confirmed and resolved a network issue autonomously using AI-driven automation and telemetry correlation." This means Marvis performed the full troubleshooting cycle-identifying the anomaly, validating its cause, and confirming resolution-based on continuous monitoring and real-time network analytics.

Other statuses include:

* UNRESOLVED: Issue is ongoing and needs attention.

* RESOLVED: Marked manually by an administrator after resolution.

* AI VALIDATED: Confirmed and closed automatically by Marvis AI.

Therefore, the correct answer is A. The issue was identified and resolved entirely by Marvis.

質問 # 56

Exhibit:

Referring to the exhibit, what does the AI Validated notification for the WAN Edge tell the user?

- A. Marvis Actions has encountered an error that requires restarting.
- B. Marvis Actions has automatically fixed the WAN Edge issue at saltlakecity-branch1.
- C. Marvis has confirmed that there is an issue at saltlakecity-branch1.
- **D. Marvis has verified that the issue is resolved and has classified the issue as AI-validated.**

正解: D

解説:

The AI Validated notification for the WAN Edge signifies that Marvis has verified the underlying issue as resolved and has classified the incident as AI-validated. According to the Juniper Mist documentation, when Marvis completes its troubleshooting workflow and determines that a previously surfaced issue is cleared - either by automated remediation or through confirmation of operational health - Marvis marks the issue as

"AI Validated." This indicates both the end of the incident lifecycle and the confidence level provided by Mist's AI that the environment is healthy and functioning as expected. The notification does not mean an error remains, nor does it confirm merely the presence of an issue, nor that Marvis performed only an automatic fix (which may also be the case, but the "AI Validated" label is for resolved/confirmed resolution status). This is most often seen as a final state within the Marvis Actions interface on the WAN Edge.

質問 #57

You are asked to configure a site in Juniper Mist.
Which statement describes completing this step?

- A. You must define your organization within the site.
- **B. You must configure the site within your organization.**
- C. You must claim your site by scanning the access point's QR code.
- D. You must first configure the country, time zone, and location at the organization level.

正解: B

解説:

You must configure the site within your organization-this is the correct process according to Juniper Mist's official configuration guides. When setting up a deployment, first an organization is created in the Mist cloud.

Within this organization, sites are added for each physical location. The Mist documentation says: "You can create Sites in the Juniper Mist portal from the Organization > Site Configuration menu. Add or update sites as needed." The configuration requires the site name, country, and location to be set at the site level-not the organization level. Claiming APs via QR codes and organization definition are separate steps in device onboarding and initial setup.

質問 #58

An AP is connected to your wired network but is not claimed to your organization.
Which type of AP would be a possible security threat in this scenario?

- **A. rogue AP**
- B. honeypot AP
- C. neighbor AP
- D. spoofed AP

正解: A

解説:

Types of APs and Security Threats:

Understanding different types of access points and their potential security threats.

Access Point Types:

Neighbor AP: An access point that belongs to a neighboring network and is not necessarily a security threat.

Rogue AP: An unauthorized access point connected to the wired network, posing a significant security threat.

Spoofed AP: An access point that mimics a legitimate one, but typically does not involve being connected to the network.

Honeypot AP: An access point set up to lure attackers, not necessarily a threat unless used maliciously.

Identifying the Threat:

An AP connected to your wired network but not claimed to your organization is considered a rogue AP and poses a security threat.
