## Latest Real EMT Exam | Valid EMT Exam Questions

The PassExamDumps is one of the top-rated and reliable platforms for quick and complete EMT exam preparation. The PassExamDumps has been offering real, valid, and updated Emergency Medical Technicians Exam exam questions for many years. Over this long time period countless NREMT EMT Exam candidates have passed their dream NREMT EMT certification and doing jobs in the world's top brands.

### NREMT Emergency Medical Technicians Exam Sample Questions (Q211-Q216):

#### NEW QUESTION # 211

You have achieved ROSC in a 77-year-old female. She remains unresponsive and her vital signs are BP 94/58, P 82, and R 18. In what position should she be placed?

- A. Supine
- B. Head elevated 45°
- C. Trendelenburg
- D. Left lateral recumbent

Answer: D

Explanation:

The correct answer is B. Left lateral recumbent.

This patient has return of spontaneous circulation (ROSC) but remains unresponsive. In such cases, airway protection becomes the priority.

According to NREMT and resuscitation guidelines:

\* Unresponsive patients who are breathing adequately should be placed in the recovery position (lateral recumbent) to maintain a patent airway and reduce the risk of aspiration.

\* This position allows secretions or vomit to drain out of the mouth instead of entering the airway.

Why B is correct:

\* "Place unresponsive patients with adequate breathing in the recovery position."

\* The left lateral recumbent position is the standard recovery position used in EMS.

Why the other options are incorrect:

\* A. Supine: Increases risk of airway obstruction and aspiration in an unresponsive patient.

\* C. Trendelenburg: Not recommended; can worsen respiratory function and does not improve outcomes.

\* D. Head elevated 45°: May be used in conscious patients or certain conditions, but not ideal for an unresponsive patient without airway control.

Exact Extracts:

\* "Unresponsive patients who are breathing adequately should be placed in the recovery position."

\* "The recovery position helps maintain an open airway and reduces aspiration risk."

\* "Airway management is the priority after ROSC."

## NEW QUESTION # 212

A 44-year-old patient with diabetes feels weak and dizzy. The EMT provides oral glucose and transports the patient to the hospital, where the patient recovers. The EMT tells their partner they did not provide the patient with a blanket because they felt the patient was wasting their time. What best describes the action the EMT took?

- A. Breach of duty
- B. Battery
- C. Negligence
- **D. Breach of ethics**

**Answer: D**

Explanation:

The correct answer is B. Breach of ethics.

This scenario describes inappropriate attitude and professional behavior by the EMT, not a failure that caused patient harm.

The EMT:

Provided appropriate medical care (oral glucose and transport)

The patient recovered

No harm resulted from not providing a blanket

However, the EMT's statement reflects:

Disrespect toward the patient

Lack of compassion

Unprofessional conduct

Why B is correct (Breach of ethics):

NREMT standards emphasize professionalism and patient respect:

EMTs are expected to treat all patients with dignity, empathy, and respect. Ethical violations occur when providers demonstrate unprofessional attitudes or disregard for patient well-being. This situation reflects a violation of ethical standards, not legal negligence.

Why the other options are incorrect:

A). Breach of duty: Requires failure to provide care that leads to harm; care was appropriately provided.

C). Negligence: Requires duty, breach, causation, and damages; no patient harm occurred.

D). Battery: Involves unauthorized physical contact; not applicable here.

Exact Extracts:

"EMS providers must demonstrate professionalism and respect toward all patients."

"Ethical conduct includes compassion and appropriate attitude."

"Negligence requires proof of harm resulting from a breach of duty."

### NEW QUESTION # 213

A choking patient becomes unresponsive. What should the EMT perform next? Select the two correct options.

- A. Check for a pulse
- B. Begin chest compressions
- C. Position the patient in recovery and administer back blows
- D. Open mouth
- E. Do not ventilate until the foreign body is removed

**Answer: A,B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

If a choking patient becomes unresponsive, EMTs should:

\* Check for a pulse

\* Begin chest compressions if no pulse is found Chest compressions can help dislodge the object. After compressions, the airway should be opened and inspected. Back blows are not appropriate for unconscious patients.

Ventilation is attempted after clearing the airway or if no object is seen. Do not withhold compressions waiting for object removal.

### NEW QUESTION # 214

An 80-year-old female who has diabetes complains of generalized weakness, nausea, vomiting, and fatigue that began 1 hour ago. She has equal hand grasp and her face is symmetrical. Her blood glucose level is 130 mg/dL. What is the most likely cause of her symptoms?

- A. Dehydration
- B. Influenza
- C. Myocardial infarction
- D. Cerebral ischemia

**Answer: C**

Explanation:

The correct answer is B. Myocardial infarction.

Key findings in this scenario:

\* Elderly patient (80 years old)

\* History of diabetes

\* Sudden onset (1 hour)

\* Nausea, vomiting, fatigue, weakness

\* Normal blood glucose (130 mg/dL)

\* No focal neurological deficits (equal grips, symmetrical face)

Why Myocardial Infarction is correct:

Elderly and diabetic patients often present with atypical symptoms of myocardial infarction, such as:

\* Generalized weakness

\* Nausea and vomiting

\* Fatigue

\* Absence of chest pain ("silent MI")

NREMT-aligned references state:

\* "Elderly and diabetic patients may present with atypical signs of myocardial infarction."

\* "Symptoms may include weakness, nausea, vomiting, and fatigue without chest pain." Why the other options are incorrect:

\* A. Cerebral ischemia (stroke)# Typically presents with neurological deficits (facial droop, unequal grip), which are absent

\* C. Dehydration# Usually more gradual onset, not sudden within 1 hour

\* D. Influenza# Typically includes fever, body aches, respiratory symptoms, not isolated acute onset Exact Extracts (NREMT-

aligned EMT educational references):

\* "Atypical presentations of MI are common in elderly and diabetic patients."

\* "Symptoms may include nausea, vomiting, fatigue, and weakness."

\* "Do not rely solely on chest pain to identify MI."

Clinical Priority Summary:

In elderly diabetic patients, sudden onset of weakness, nausea, and fatigue strongly suggests an atypical myocardial infarction, making B the correct answer.

### NEW QUESTION # 215

During a mass casualty incident, a patient has an open tibia and fibula deformity. Using START triage, in which of the following priorities should the EMT place the patient?

- A. Immediate
- B. Emergent
- C. Minimal
- D. Delayed

**Answer: D**

Explanation:

The START (Simple Triage and Rapid Treatment) system classifies patients based on ability to walk, respirations, perfusion, and mental status. A patient with an open fracture who can breathe adequately, has a pulse, and follows commands is categorized as "Delayed".

Immediate (Red) is reserved for those who cannot walk and have life-threatening conditions, such as compromised airway or severe bleeding.
