Latest Ping Identity PAP-001 Dumps Free & PAP-001 Pdf Demo Download

Our customers comment that the PAP-001 latest dumps pdf covers most questions of actual test. Most questions in our PAP-001 dumps valid will appear in the real test because Ping Identity exam prep is created based on the formal test. If you practice the PAP-001 Test Questions and remember the key points of study guide, the rate of you pass will reach to 95%.

Ping Identity Certified Professional - PingAccess Sample Questions (Q62-Q67):

NEW QUESTION # 62

The application team has changed their directory paths. An administrator must adjust the following paths:

- * /images/site/
- * /images/site/checkout/default.html
- * /images/site/homepage/english/default.html

Which pattern would match the paths?

- A. /images/site*
- **B. /images/site/***
- C. /images/site/checkout
- D. /images/site/english/*

Answer: B

Explanation:

The pattern /images/site/* matches all subpaths and files under the /images/site/ directory, including nested paths.

Exact Extract:

"The asterisk (*) matches zero or more characters within the path. For example, /images/site/* matches all resources under the site folder."

* Option A is incorrect - it references /site/ instead of /site/.

* Option B is incorrect - /site/* matches strings beginning with "site", but may also match "siteX" incorrectly.

* Option C is incorrect - it only matches resources under /english/, missing other folders.

* Option D is correct - /images/site/* covers all given examples.

Reference: PingAccess Administration Guide - Resource Path Matching

NEW QUESTION # 63

Users report the following about access to an application:

* Inconsistent behavior depending on the browser used

* Denied access

* Prompt to accept a security exception

Which configuration option should the administrator adjust?

- **A. SameSite Cookie**
- B. Enable PKCE
- C. Validate Session
- D. Request Preservation

Answer: A

Explanation:

Modern browsers enforce stricter cookie handling rules. If cookies are not configured correctly with the SameSite attribute, behavior can differ across browsers, leading to inconsistent authentication and access denials. Security exceptions may appear when session cookies are blocked.

Exact Extract:

"The SameSite cookie setting defines how browsers send cookies in cross-site requests. Misconfigured SameSite values can lead to inconsistent application behavior across browsers."

* Option A (Enable PKCE) is related to OAuth flow security, not browser cookie behavior.

* Option B (SameSite Cookie) is correct - this directly explains the inconsistent browser issues.

* Option C (Request Preservation) ensures query parameters are kept, not related to cross-browser session handling.

* Option D (Validate Session) checks session state but does not address browser inconsistencies.

Reference: PingAccess Administration Guide - Web Session Cookie Settings

NEW QUESTION # 64

An administrator configures PingAccess to use PingFederate as the token provider. Which benefit does this provide?

- A. The ability to define new OAuth clients in PingFederate from within PingAccess
- B. The ability to manage token issuance criteria from within PingAccess
- C. The ability to use Single Sign-On support for the administrative console and OAuth for Admin API
- **D. The automatic population of the Client ID field for selection in creating or editing a Web Session**

Answer: D

Explanation:

When PingAccess is integrated with PingFederate as a Token Provider, the OAuth clients already configured in PingFederate

become available in PingAccess. This enables administrators to automatically select Client IDs when creating Web Sessions.

Exact Extract:

"When PingAccess uses PingFederate as its token provider, PingFederate OAuth clients appear automatically in PingAccess for selection during web session configuration."

- * Option A is incorrect - this refers to Admin Console authentication, which is separate.
- * Option B is incorrect - OAuth clients must be created in PingFederate, not from within PingAccess.
- * Option C is incorrect - token issuance policies are managed in PingFederate, not PingAccess.
- * Option D is correct - the Client ID dropdown is populated automatically from PingFederate.

Reference: PingAccess Administration Guide - Token Provider Configuration

NEW QUESTION # 65

A company has removed the requirement to record back-channel requests from PingAccess to PingFederate in the audit log. Where should the administrator update this behavior without affecting existing applications?

- A. Sites
- **B. Token Validation**
- C. Token Provider
- D. Web Sessions

Answer: B

Explanation:

PingAccess can be configured to log or suppress back-channel requests that occur during token validation with an OAuth/OpenID Connect provider such as PingFederate. These requests happen when PingAccess calls PingFederate to validate access tokens or retrieve key material.

* Exact Extract from PingAccess documentation:

"Back-channel requests are logged during token validation by default. To prevent these requests from being written to the audit log, update the Token Validation settings in PingAccess." This makes Token Validation the correct location for changing the behavior without modifying application-specific configurations.

Why other options are wrong:

- * B. Web Sessions
- * Incorrect. Web Sessions control user session management and cookie handling, not back-channel token validation traffic.
- * C. Sites
- * Incorrect. Sites are the definitions of backend servers that PingAccess proxies to. This setting does not affect back-channel logging to PingFederate.
- * D. Token Provider
- * Incorrect. The Token Provider defines the OIDC/OAuth server (e.g., PingFederate) and its endpoints, but the logging of back-channel requests is not controlled here.

Thus, the correct answer is A. Token Validation.

Reference: PingAccess Administration Guide - Managing Token Validation section.

NEW QUESTION # 66

A protected web application requires that additional attributes be provided once the user is authenticated.

Which two steps must the administrator perform to meet this requirement? (Choose 2 answers.)

- A. Update the Site Authenticator.
- B. Request that the token provider update the ID token with the additional attributes.
- **C. Update the Web Session.**
- D. Request that the token provider update the access token with the additional attributes.
- **E. Update the Identity Mapping.**

Answer: C,E

Explanation:

When applications require additional attributes:

- * The Web Session must be configured to retrieve those attributes from the token provider (OIDC or PingFederate).
- * The Identity Mapping must be updated to forward those attributes to the application (e.g., as headers).

Exact Extract:

"Web sessions define how user attributes are retrieved from the token provider. Identity mappings determine how those attributes

are inserted into requests to applications."

* Option A is not necessarily required; attributes can be retrieved via userinfo endpoint or access token, not only ID tokens.

* Option B is correct - Identity Mappings must be updated to pass attributes to the app.

* Option C is incorrect - Site Authenticators define how PingAccess authenticates to apps, not attribute handling.

* Option D is incorrect unless the architecture specifically requires access token updates; PingAccess often uses the Web Session to fetch attributes.

* Option E is correct - Web Session must be updated to retrieve additional attributes.
