最新的 CompTIA Cybersecurity Analyst CS0-003 免費考試真題 (Q141-Q146):

問題 #141
A security analyst is performing a malware analysis on a device and receives the following instructions:
- Reduce the blast radius of the potential threat.
- Preserve forensic data for post-incident analysis.
- If securely possible, preserve connectivity for live analysis.
Which of the following will best help the analyst during the investigation?

- A. Collect the suspicious file using SFTP and reimage the device.
- B. Execute a SOAR playbook to trigger a malware scan on the company's assets.
- C. Use file integrity monitoring to determine if the suspicious file was modified.
- D. Configure an EDR agent to isolate the network with authorized exceptions to the NOC VLAN.

答案：D

解題說明：
Using the EDR's network-isolation feature contains the infected host (shrinking its blast radius) while still permitting controlled access from a management or NOC VLAN for live analysis and forensic collection. This meets all three objectives without destroying data

or cutting off analysis.

問題 #142
Which of the following evidence collection methods is most likely to be acceptable in court cases?

- A. Providing a full system backup inventory
- B. Providing a bit-level image of the hard drive
- C. Creating a file-level archive of all files
- D. Copying all access files at the time of the incident

答案：B

解題說明：
Abit-level imageis a forensic-grade copy that preservesalldata on a disk, including unallocated space, deleted files, and metadata. This is the most legally defensible form of digital evidence collection, as it ensures that no potential evidence is missed.
* Copying all access files (Option A)only captures live files and omits deleted or system-level artifacts that may be critical.
* Creating a file-level archive (Option B)is insufficient because it does not capture system metadata or slack space where forensic artifacts reside.
* Providing a full system backup inventory (Option C)may include important files, but it lacks forensic integrity because backups often modify timestamps and do not capture all system states.
Thus, the correct answer isD, as abit-level image ensures forensic integrity and completeness of evidence.

問題 #143
A SOC manager receives a phone call from an upset customer. The customer received a vulnerability report two hours ago: but the report did not have a follow-up remediation response from an analyst. Which of the following documents should the SOC manager review to ensure the team is meeting the appropriate contractual obligations for the customer?

- A. Limitation of liability
- B. MOU
- C. NDA
- D. SLA

答案：D

解題說明：
SLA stands for service level agreement, which is a contract or document that defines the expectations and obligations between a service provider and a customer regarding the quality, availability, performance, or scope of a service. An SLA may also specify the metrics, penalties, or remedies for measuring or ensuring compliance with the agreed service levels. An SLA can help the SOC manager review if the team is meeting the appropriate contractual obligations for the customer, such as response time, resolution time, reporting frequency, or communication channels.

問題 #144
You are a penetration tester who is reviewing the system hardening guidelines for a company. Hardening guidelines indicate the following.
There must be one primary server or service per device.
Only default port should be used
Non- secure protocols should be disabled.
The corporate internet presence should be placed in a protected subnet
Instructions :
Using the available tools, discover devices on the corporate network and the services running on these devices.
You must determine
ip address of each device
The primary server or service each device
The protocols that should be disabled based on the hardening guidelines

問題 #145
Which of following would best mitigate the effects of a new ransomware attack that was not properly stopped by the company antivirus?

- A. Implement vulnerability management.
- B. Update the application blocklist.
- C. Deploy sandboxing.
- D. Install a firewall.

答案：C

解題說明：
Sandboxing is a technique that isolates potentially malicious programs or files in a controlled environment, preventing them from affecting the rest of the system. It can help mitigate the effects of a new ransomware attack by preventing it from encrypting or deleting important data or spreading to other devices.
