Salesforce Certified MuleSoft Associate Sample Questions (Q38-Q43):

NEW QUESTION # 38

A MuteSoft developer must implement an API as a Mule application, run the application locally, and execute unit tests against the running application Which Anypoint Platform component can the developer use to fulfill all of these requirements?

- A. Anypoint CLI
- B. API Manager
- C. API Designer
- D. Anypoint Studio

Answer: D

Explanation:

Anypoint Studio is the integrated development environment (IDE) provided by MuleSoft for designing, developing, and testing Mule applications. Here's how it fulfills the developer's requirements:

API Implementation:

Design and Development: Anypoint Studio provides a graphical interface to design and develop APIs as Mule applications using pre-built components and connectors.

Running Applications Locally:

Local Testing: Developers can run Mule applications locally within Anypoint Studio to test and debug them before deploying to production.

Unit Testing:

MUnit Integration: Anypoint Studio includes MUnit, MuleSoft's testing framework. Developers can create and execute unit tests directly within the IDE.

Test Execution: These tests can be run against the locally running Mule application to validate functionality and ensure code quality.

MuleSoft Documentation: Anypoint Studio

MUnit Testing: MUnit

NEW QUESTION # 39

According to MuleSoft a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system is an example of which system integration interaction pattern?

- A. Request-Reply
- B. One-way
- C. Multicast
- D. Batch

Answer: A

Explanation:

In system integration, different interaction patterns are used depending on the communication requirements between systems. For a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system, the Request-Reply pattern is used. Here's a detailed explanation:

Request-Reply Pattern:

Definition: This pattern involves a client sending a request to a server and waiting for a reply. The communication is synchronous, meaning the client waits for the server to process the request and send back the response.

Typical Use Case: It is used when immediate feedback is required from the server, such as retrieving a specific customer record.

RESTful API and HTTP:

Synchronous Communication: HTTP is inherently synchronous, making it suitable for Request-Reply interactions where the client expects an immediate response.

Data Retrieval: Commonly used for GET requests in RESTful APIs to retrieve data from a server.

Example:

Scenario: A client application requests customer details by making a GET request to a RESTful API endpoint. The server processes the request and returns the customer record.

NEW QUESTION # 40

Which key DevOps practice and associated Anypoint Platform component should a MuleSoft integration team adopt to improve delivery quality?

- A. Manual testing with Anypoint Studio
- B. Automated testing with MUnit
- C. Passive monitoring with Anypoint Monitoring
- D. Continuous design with API Designer

Answer: B

Explanation:

To improve delivery quality, a key DevOps practice is automated testing. Within the Anypoint Platform, MUnit is the tool specifically designed for this purpose. Here's a step-by-step explanation:

Automated Testing:

Definition: Automated testing involves using software tools to execute tests on the application automatically, ensuring that the code works as expected.

Benefits: It increases efficiency, consistency, and coverage of tests, reducing the risk of human error.

MUnit:

Integration Testing: MUnit is MuleSoft's integrated testing framework for applications built with Anypoint Studio. It allows developers to create and run tests for Mule applications, ensuring they function correctly.

Features:

Test Cases: Create comprehensive test cases to validate various parts of the Mule application.

Mocking: Mock external systems and dependencies, enabling isolated testing of application components.

Assertions: Validate the behavior of Mule flows with assertions.

Implementation Steps:

Design Tests: Within Anypoint Studio, design MUnit tests to cover different scenarios and edge cases of the Mule flows.

Run Tests: Execute these tests automatically during the CI/CD pipeline to ensure that new code changes do not break existing functionality.

Continuous Integration: Integrate MUnit tests with CI tools like Jenkins, Bamboo, or GitLab CI for continuous testing.

NEW QUESTION # 41

Which component of Anypoint Platform belongs to the platform control plane'?

- A. Runtime Fabric
- **B. API Manager**
- C. Runtime Replica
- D. Anypoint Connectors

Answer: B

Explanation:

In Anypoint Platform, the control plane is responsible for managing and controlling the various components and services that make up the platform. API Manager is part of the control plane, providing centralized management of APIs. Here's a detailed explanation:

Control Plane:

Definition: The control plane in Anypoint Platform is responsible for the management, monitoring, and control of APIs, applications, and other platform resources.

Components: Includes tools for API management, analytics, security, and governance.

API Manager:

Purpose: Allows users to manage API policies, monitor API usage, and secure APIs. It provides a centralized interface for managing the entire lifecycle of APIs.

NEW QUESTION # 42

An integration team follows MuleSoft's recommended approach to full lifecycle API development. Which activity should this team perform during the API implementation phase?

- A. Validate the API specification
- B. Design the API specification
- C. Use the API specification to monitor the MuleSoft application
- **D. Use the API specification to build the MuleSoft application**

Answer: D

Explanation:

MuleSoft recommends a full lifecycle API development approach which includes several phases such as design, implementation,

testing, deployment, and management. During the API implementation phase, the primary activity is to use the API specification to build the MuleSoft application. Here's a detailed explanation:

API Design:

Create API Specification: Initially, an API specification is created using RAML or OAS (OpenAPI Specification) to define the API's structure, endpoints, request/response formats, and security requirements.

API Implementation:

Build Mule Application: Using the API specification as a blueprint, the development team implements the MuleSoft application. This involves creating flows, integrating with backend systems, and ensuring the API functions as specified.

APIKit: MuleSoft provides APIKit, a tool that automatically generates Mule flows based on the API specification, speeding up the development process.

Testing: During implementation, unit tests (using MUnit) and integration tests are created to ensure the API behaves as expected.

Validation and Monitoring:

Validate Against Specification: Throughout the implementation phase, the API is continuously validated against the original specification to ensure compliance.

Deployment and Monitoring: Post-implementation, the API is deployed, and tools like Anypoint Monitoring are used to monitor its performance and usage.
