## Terraform-Associate-004 Valid Braindumps Files, Dumps Terraform-Associate-004 Collection

After undergoing a drastic change over these years, our Terraform-Associate-004 actual exam have been doing perfect job in coping with the exam. Up to now our Terraform-Associate-004 practice materials account for 60 percent of market share in this line for their efficiency and accuracy when dealing with the exam. With the best reputation in the market our Terraform-Associate-004 Training Materials can help you ward off all unnecessary and useless materials and spend all your limited time on practicing most helpful questions.

## HashiCorp Certified: Terraform Associate (004) (HCTA0-004) Sample Questions (Q108-Q113):

### NEW QUESTION # 108

In a HCP Terraform/Terraform Cloud workspace linked to a version control repository, speculative plan runs start automatically when you merge or commit changes to version control.

- A. True
- B. False

Answer: A

Explanation:

Speculative Plans: Terraform Cloud's speculative plan feature runs automatically when changes are detected in a linked VCS repository, enabling users to review potential infrastructure changes without committing them.

Automatic Integration: This feature automates the planning process by triggering when changes are committed, aiding teams in previewing infrastructure changes seamlessly.

For further understanding, see the Terraform Cloud VCS Integration documentation.

### NEW QUESTION # 109

Which of the following is not true of Terraform providers?

- A. Cloud providers and infrastructure vendors can write, maintain, or collaborate on Terraform
- B. An individual person can write a Terraform Provider
- C. None of the above
- D. HashiCorp maintains some providers
- E. A community of users can maintain a provider
- F. providers

**Answer: C**

Explanation:

All of the statements are true of Terraform providers. Terraform providers are plugins that enable Terraform to interact with various APIs and services<sup>1</sup>. Anyone can write a Terraform provider, either as an individual or as part of a community<sup>2</sup>. HashiCorp maintains some providers, such as the AWS, Azure, and Google Cloud providers<sup>3</sup>. Cloud providers and infrastructure vendors can also write, maintain, or collaborate on Terraform providers, such as the VMware, Oracle, and Alibaba Cloud providers. Reference

=

\* 1: Providers - Configuration Language | Terraform | HashiCorp Developer

\* 2: Plugin Development - How Terraform Works With Plugins | Terraform | HashiCorp Developer

\* 3: Terraform Registry

\* : Terraform Registry

### NEW QUESTION # 110

How can a ticket-based system slow down infrastructure provisioning and limit the ability to scale? Choose two correct answers.

- A. End-users have to request infrastructure changes
- B. Ticket based systems generate a full audit trail of the request and fulfillment process
- C. The more resources your organization needs, the more tickets your infrastructure team has to process
- D. Users can access catalog of approved resources from drop down list in a request form

**Answer: A**

Explanation:

These are some of the ways that a ticket-based system can slow down infrastructure provisioning and limit the ability to scale, as they introduce delays, bottlenecks, and manual interventions in the process of creating and modifying infrastructure.

### NEW QUESTION # 111

When using Terraform to deploy resources into Azure, which scenarios are true regarding state files? (Choose two.)

- A. Changing resources via the Azure Cloud Console records the change in the current state file
- B. Changing resources via the Azure Cloud Console does not update current state file
- C. When you change a Terraform-managed resource via the Azure Cloud Console, Terraform updates the state file to reflect the change during the next plan or apply
- D. When you change a resource via the Azure Cloud Console, Terraform records the changes in a new state file

**Answer: B,C**

Explanation:

Terraform state is a representation of the infrastructure that Terraform manages. Terraform uses state to track the current status of the resources it creates and to plan future changes. However, Terraform state is not aware of any changes made to the resources outside of Terraform, such as through the Azure Cloud Console, the Azure CLI, or the Azure API. Therefore, changing resources

via the Azure Cloud Console does not update the current state file, and it may cause inconsistencies or conflicts with Terraform's desired configuration. To avoid this, it is recommended to manage resources exclusively through Terraform or to use the terraform import command to bring existing resources under Terraform's control.

When you change a Terraform-managed resource via the Azure Cloud Console, Terraform does not immediately update the state file to reflect the change. However, the next time you run terraform plan or terraform apply, Terraform will compare the state file with the actual state of the resources in Azure and detect any drifts or differences. Terraform will then update the state file to match the current state of the resources and show you the proposed changes in the execution plan. Depending on the configuration and the change, Terraform may try to undo the change, modify the resource further, or recreate the resource entirely. To avoid unexpected or destructive changes, it is recommended to review the execution plan carefully before applying it or to use the terraform refresh command to update the state file without applying any changes.

Reference = Purpose of Terraform State, Terraform State, Managing State, Importing Infrastructure, [Command: plan], [Command: apply], [Command: refresh]

### NEW QUESTION # 112

In Terraform HCL, an object type of object( {name=string, age=number} ) would match this value.

- A. Option C
- B. Option A
- C. Option D
- **D. Option B**

**Answer: D**

Explanation:

From the official Terraform Type Constraints Documentation:

The object( { name = string, age = number } ) type expects:

name to be a quoted string, e.g. " John "

age to be a number, e.g. 52

Option B satisfies both:

```
{
name = " John " ##Valid string
age = 52 ##Valid number
}
```

Let's analyze the incorrect ones:

#Option A: " fifty two " is not a valid number.

#Option C: John is unquoted (invalid string), and " fifty two " is not a number.

#Option D: name = John is not quoted, making it an invalid string in HCL.

Terraform is strict about type and formatting. Strings must be quoted, and numbers must be numeric literals.

### NEW QUESTION # 113

.....

As a market leader, our company is able to attract quality staff; it actively seeks out those who are energetic, persistent, and professional to various Terraform-Associate-004 certificate and good communicator. Over 50% of the account executives and directors have been with the Group for more than ten years. The successful selection, development and Terraform-Associate-004 training of personnel are critical to our company's ability to provide a high standard of service to our customers and to respond their needs. That's the reason why we can produce the best Terraform-Associate-004 exam prep and can get so much praise in the international market.
