error -999 - - (from Template Group Corp-SOT_Branch) (in Template branches)
invalid ip - prop[gateway]: ip4class(${sdwan_port1_gw}) invalid ip addr

```

When you install the device settings, FortiManager prompts you with the error "Copy Failed" for the device branch1\_fgt. When you click the log button, FortiManager displays the message shown in the exhibit.

There are two different ways to resolve this issue. Based on the exhibits, which methods could you use? (Choose two.)

- A. Review the per-device mapping configuration for metadata variables
- B. Do not define installation targets for SD-WAN members.
- C. Specify the gateway of the SD-WAN member port1 with an IP address or use the default value.
- D. Update the management IP address of branch1\_fgt.

**Answer: A,C**

Explanation:

Specify the gateway of the SD-WAN member port1 with an IP address or use the default value → The error log shows invalid ip - prop[gateway]: ip4class(\${sdwan\_port1\_gw}) invalid ip addr, meaning the variable \${sdwan\_port1\_gw} does not have a valid mapping. Assigning a valid IP address or default value for the gateway resolves this error.

Review the per-device mapping configuration for metadata variables → The issue is tied to how the metadata variable \${sdwan\_port1\_gw} is mapped for branch1\_fgt. If this device does not have the variable properly defined in per-device mapping, the configuration will fail. Correcting the mapping ensures that the install works.

**NEW QUESTION # 50**

For a large SD-WAN deployment, adding each branch device one by one would be repetitive and time consuming. Fortunately, to simplify this step, FortiManager provides a CSV file import feature.

To use this bulk import feature, the administrator builds a CSV file. The file must contain some mandatory values, such as the device serial numbers, the device names, and the associated blueprints, as well as optional values for the metadata variables used in the configuration.
