## Salesforce Certified MuleSoft Developer (Mule-Dev-201) Sample Questions (Q209-Q214):

### NEW QUESTION # 209

A shopping API contains a method to look up store details by department To get information for a particular store, web clients will submit requests with a query parameter named department and a URI parameter named storeId.

What is a valid RAML snippet that supports requests from web clients to get data for a specific storeId and department name?

- A. 

```
/{storeId}:
  get:
    queryParameters:
      department:
```
- B. 

```
get:
  queryParameters:
    department:
  uriParameters:
    storeId:
```
- C. 

```
/department:
  get:
    uriParameter:
      storeId:
```
- D. 

```
get:
  uriParameters:
    {storeId}:
  queryParameters:
    department:
```

**Answer: A**

Explanation:

Lets revise few concepts RAML which can help us to find the answer of this question.

URI Parameters

Lets have a look at below example.

/foos:

/ {id}:

/name/ {name}:

Here, the braces { } around property names define URI parameters. They represent placeholders in each URI and do not reference root-level RAML file properties as we saw above in the baseUri declaration. The added lines represent the resources /foos/ {id} and /foos/name/ {name}.

Query Parameters

Now we'll define a way to query the foos collection using query parameters. Note that query parameters are defined using the same syntax that we used above for data types:

/foos:

get:

description: List all Foos matching query criteria, if provided;

otherwise list all Foos

queryParameters:

name?: string

ownerName?: string

Based on the above information , below is the only option which defines storeid as uri parameter and department as query parameter.

/ {storeId}:

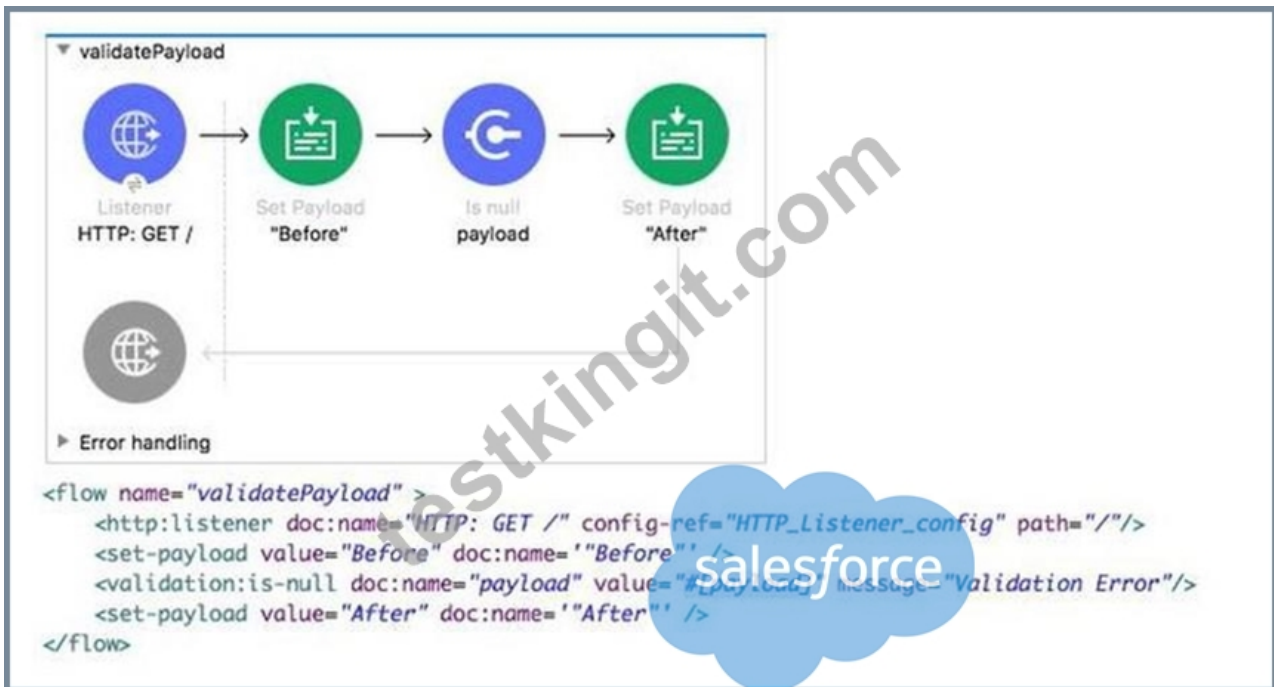

get:

queryParameter:

department:

## NEW QUESTION # 210

Refer to the exhibits.

What is the response when a client submits a request to http://localhost:8081?

- A. null
- B. Before
- C. Validation error
- D. After

**Answer: C**

Explanation:

Here's specifically what is happening here:

1) Payload is successfully set to "Before"

2) Is null validation is used which will pass the message only if payload is null. In this case as payload is not null, it creates an Error Object. Flow execution stops

`#[error.description] = "Validation error"`

3) Because no error handler is defined, the Mule default error handler handles the error

4) "Validation error" is the error message returned to the requestor in the body of the HTTP request with HTTP Status Code: 500

### NEW QUESTION # 211

Which Mule component provides a real-time, graphical representation of the APIs and mule applications that are running and discoverable?

- A. Runtime Manager
- **B. Anypoint Visualizer**
- C. API Notebook
- D. API Manager

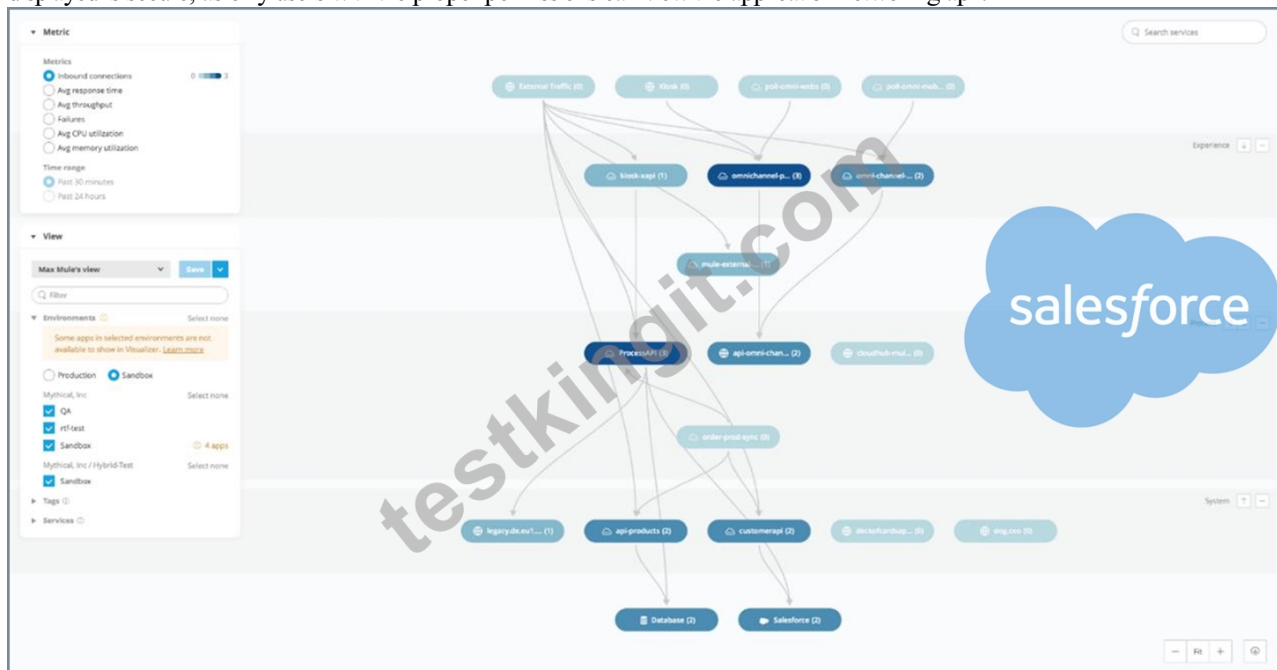

**Answer: B**

Explanation:

Correct answer is Anypoint Visualizer

MuleSoft Doc Ref : <https://docs.mulesoft.com/visualizer/>

Anypoint Visualizer provides a real-time, graphical representation of the APIs, and Mule applications that are running and discoverable. It also displays third-party systems that are invoked by a Mule API, proxy, or application within your application network. The data displayed in the graph is dynamically updated and does not require prior configuration. Additionally, the data displayed is secure, as only users with the proper permissions can view the application network graph.
