WGU Managing Cloud Security (JY02) Sample Questions (Q38-Q43):

NEW QUESTION # 38

Which group should be notified for approval when a planned modification to an environment is scheduled?

- A. Problem management team
- B. Change management board
- C. Executive management board
- D. Event management team

Answer: B

Explanation:

The Change Management Board (CMB), also called the Change Advisory Board (CAB), is the formal authority responsible for reviewing, assessing, and approving planned modifications to IT environments. This group ensures that proposed changes align with business objectives, do not introduce unnecessary risks, and comply with security and regulatory requirements.

Event management teams focus on monitoring events, problem management teams handle root-cause analysis, and executive boards provide strategic direction but are not operational approval authorities. Only the CMB has the explicit role of validating technical and security implications before implementation.

By involving the CMB, organizations enforce structured governance, minimize disruptions, and establish accountability. This practice is central in ITIL and ISO/IEC 20000 standards, ensuring that operational integrity and security are preserved during change cycles.

NEW QUESTION # 39

Which tool should a developer use to describe the requirements they have gathered for a code improvement they are tasked with making as part of a current release?

- A. Cases
- B. Stories
- C. Cookies
- D. Notes

Answer: B

Explanation:

In Agile development, user stories are the standard way to capture requirements for new features or improvements. A user story describes the functionality from the perspective of the end user, ensuring that development aligns with business needs.

"Cases" might refer to test cases, which validate requirements, but they are not used to describe them.

Cookies are technical elements for web sessions, and notes are informal documentation.

User stories typically follow a format such as: "As a [role], I want [goal] so that [benefit]." This provides clarity, fosters communication between developers and stakeholders, and ensures that acceptance criteria can be defined and tested. Using stories as a requirement tool aligns with iterative, customer-focused release cycles.

NEW QUESTION # 40

Which release management term describes the process from code implementation to code review and approval to automated testing and then to production deployment?

- A. Pipeline
- B. Iteration
- C. Baseline
- D. Framework

Answer: A

Explanation:

A pipeline refers to the structured process of moving code from development to production, encompassing implementation, review, automated testing, and deployment. In DevOps, this is known as a CI/CD pipeline (Continuous Integration/Continuous Deployment).

An iteration refers to a development cycle, a baseline represents a stable reference configuration, and a framework provides structure but not a deployment sequence. Only pipeline accurately captures the sequential, automated flow of code into production. Pipelines enhance efficiency, consistency, and quality assurance by automating repetitive tasks, reducing human error, and ensuring that code changes are validated before reaching production. They are essential for modern cloud-native applications where rapid deployment is expected.

NEW QUESTION # 41

Which cloud computing service model allows customers to run their own application code without configuring the server environment?

- A. Data science as a service (DSaaS)
- B. Platform as a service (PaaS)
- C. Infrastructure as a service (IaaS)
- D. Software as a service (SaaS)

Answer: B

Explanation:

Platform as a Service (PaaS) allows customers to focus on writing and deploying code without managing the underlying infrastructure. The provider manages the operating system, runtime, and middleware, enabling faster development cycles and reduced administrative overhead.

IaaS would require the customer to configure servers and operating systems, SaaS provides ready-to-use applications, and DSaaS is a specialized category for analytics.

By abstracting the infrastructure, PaaS accelerates innovation and reduces operational burden but also limits flexibility in some cases. Security responsibilities under PaaS focus on application-level controls, while the provider handles infrastructure-level protections.

NEW QUESTION # 42

During a financial data investigation, the investigator is unsure how to handle a specific data set. Which set of documentation should they refer to for detailed steps on how to proceed?

- A. Legal rulings
- B. Policies
- C. Legal definitions
- D. Procedures

Answer: D

Explanation:

Procedures are detailed, step-by-step instructions that guide personnel on how to perform specific tasks in alignment with higher-level policies. In an investigation, when uncertainty arises about handling a dataset, procedures provide the exact operational guidance required.

Policies establish high-level rules (e.g., "financial data must be protected"), while procedures explain how to achieve compliance with those policies (e.g., "verify encryption, label dataset, log access, and escalate to compliance officer"). Legal rulings and definitions are external references but do not provide operational steps.

By following documented procedures, investigators ensure consistency, compliance, and defensibility in legal contexts. This also ensures that evidence is handled properly, supporting admissibility in court and protecting the organization against legal or regulatory challenges.
